A large Pyrex mixing bowl has been used as a bell jar. The base plate
was a sheet of 1/2" Al with wide foam weather strip on the rim of
the bowl serving as a vacuum seal. The base plate is fitted with a
threaded fitting for the vacuum pump and an other test ports. The
EOSS vacuum chamber is a 10"x16"x16" box made from 5/8" plexiglas sheet
epoxied at the seams. It does flex noticeably, however.

EOSS's chamber was a donation from a company that used it for testing
smoke detectors, and we got got a 1/2 HP Welch vane pump from an
Ebay seller for $75 - cheap because of a badly frayed power cord and
some contamination in the oil. It does pull down to 0.8 Torr (>150K'),
however, on a good day. I've attached a lousy pix.

An interesting resource: http://www.belljar.net/index.htm

You can but a Venturi type vacuum pump for $10 from Harbor Freight (item number 92475):
http://www.harborfreight.com/cpi/ctaf/displayitem.taf?Itemnumber=92475

These work with compressed air flow. I'm not sure if they'll meet your needs but are inexpensive. I've read of wood workers stabilizing wood with vacuum systems and high power rocket motor makers use vacuum systems to de-gas propellant mixtures. Mixing bowls with Lexan (and even plywood) covers seal well enough to hold the vacuum.

Not sure if this helps but thought I'd throw it out there. Google searches would probably find some ideas for a chamber of some type.

Pete

So we need to build a Styrofoam box under the metal bottom of a vacuum chamber. Without a functioning fan to ciculate cold air, we're relying on thermal conduction to chill the payload.

It seems to me that vacuum systems are expensive. I wonder if something could be rigged up in a metal enclosure. We really don't need to see inside the chamber. Or if we have to, we could use a small, cheap digital camcorder and light.

Paul

>>> Mike Manes <mrmanes@...> 03/27/08 8:35 PM >>>
Hi John,

Of course, it would be possible to put dry ice in a vacuum chamber,
but the sublimation temperature would drop considerably. From my Dad's
1937 Ed of Hdbk Chem Phys, the saturated vapor temp of solid CO2 at 10
mbar (100K') is about -120C, compared to -80C at 1 atm. But since the
dry ice isn't that cold by the time you get it, the vacuum would most
likely cause the vaporization rate to accelerate.

Since C02 combines with water vapor to form carbonic acid, one may risk
corrosion damage to the vacuum pump. If the dry ice were enclosed in
a pressure vessel at room ambient with good thermal conduction, that
problem could be averted.

Such a system would allow one to evaluate the effectiveness of heat
sinks, however, which lose effectiveness as convectors at 10 mbar and
thus must rely on radiative heat transfer to the environment. Fortunately,
radiative transfer varies as the 4th power of temperature difference.

Umm, a pyrex mixing bowl and $10 vacuum pump. I think I see an article here.

Paul

PS, I suppose the system wouldn't have to simulate 85,000 feet exactly. But if it's cheap and reasonably effective.....

>>> "Pete Lilja" <plilja@...> 03/27/08 9:04 PM >>>

Here's a chamber I built last year:

http://blizzard.rwic.und.edu/~nordlie/vacuum_chamber/

It's made from 8" PVC pipe, some 1/2" thick lexan squares,
gaskets cut from rubber sheet, and pumped down by two dry
vane compressors hooked in series.

The pumps will only pull around 25" of mercury (sorry for
the obsure units, that's the only gauge I had), which if I
recall correctly is only about 50k feet worth of altitude
(someone correct me if I'm wrong).

My concern with trying to cool this is that the plastic might
get brittle at such cold temps. I suppose a steel tank from
an air compressor would make a decent chamber, if one end were
cut off and a flange welded on.

From: Mike Manes
Topic: 4118 Message: 4131

Those venturi pumps don't pull much vacuum. Even diaphragm recip
pumps will only pull down to about 100 mbar (50K'). Look for oil-type
vane pumps to get above 100K'. Some folks have had luck with refrigeration
compressors, but most rely on freon for lube and cooling.

Hi John,

Your vacuum guage most likely reads relative to your ambient pressure rather than absolute. At sea level, standard baro pressure is 29.92" Hg. If that were your ambient, then the absolute vacuum you read was 29.92 - 25 = 4.92"Hg x 25.4 mm/in = 125 mmHg or about 43K'.

BTW, I don't think any other physical parameter has as many different units of measure as pressure. E.g., psi, Torr, Bar, Atm, Pascal, mmHg, inHg, kg/cm^2, inH20, etc. ad nauseum.

Fortunately, there are a few "aliases":
1 mmHg = 1 Torr
1 hPa = 1 mbar
1 bar = 1 atm

And there are a few rules of thumb:
1 Atm = 760 Torr = 1013 mbar (used to be 1000 mbar)
Baro pressure drops by a factor of 10 every 50K', so 50K' -> 100 mbar, 100K' -> 10 mbar, 150K' -> 1 mbar. See why it's tough to hit 120K'?

From: Mike Manes
Topic: 4118 Message: 4134

BTW, a mercury manometer can make for a good, accurate absolute
pressure guage, if it's filled completely to one sealed end. When the
Hg column is turned vertical so the filled end is at the top,
the top will develop a near perfect hard vacuum as a reference.
Getting mercury nowdays is harder than getting a ton of ammonium
nitrate, sadly.

4136. [Fwd: TWIG]

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-28 18:48:09 UTC
From: Mike Manes
Topic: 4136 Message: 4136

A kewl alternative to FindMeSpot that uses GSM cell sites vice satcomm
for backhaul. One can hit it direct from one's cell within range.
But kinda pricey at EU399 (US$638 nowadays!) - seems the web mapping
feature is free though. And I don't think GSM is widely available
in the US yet.

Norm passed on a message from a Finnish researcher who put it on
a high altitude payload and used it for recovery on 2 separate flights.

AT&T and T-Mobile is GSM here, sparkfun.com may have cheaper raw
serial GSM modules that you could use.

Thanks,
Dan

4138. TWIG and FindMeSpot GPS trackers

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-28 20:10:43 UTC
From: wb8elk@aol.com
Topic: 4138 Message: 4138

Hi Mike,

Sounds neat on the TWIG but that sure is pricey. The big advantage I can see for the FindMeSpot is that it will work in places where there is no GSM cell coverage or APRS coverage. I really like that direct uplink to the satellites. Unfortunately the other Globalstar, Iridium and Inmarsat options require you to buy satellite modems that are over $1000 each and with very pricey usage charges, so the FindMeSpot is incredibly attractive as far as price and usage fees (they get this pricing since they are only sending a 9 byte message each time)...unfortunately, it won't work above 60k feet or give altitude readings....but since it comes back to life after passing below 60k feet, it sure does make a great backup recovery system.

I have my Spot unit disassembled on my workbench....looks like I might be able to get it to do greater than 24 hour reporting without too much trouble, but replacing the onboard GPS receiver with one that works above 60k feet is probably not very doable since the GPS chipset and antenna is highly integrated into the single circuit board of the Spot.

Hi Bill,

I guess one advantage that the Twig GSM unit has is that you can "ping" it from your cell phone directly when no cell sites are available. If one goes to the "last heard" location during descent, that could put you in such a "simplex" range.

GL putting mods in. I kinda doubt that the schematic is available on the web :={. And even if you were able to get an OpenScud GPS engine hooked in, the link protocol prolly doesn't support GGA.

BTW, since most new cell phones are E911-enabled, could you get backup location data simply by calling the cell phone on the payload? Now, don't even ASK about what the roaming charges might come to!

Is anyone keeping track of the color distribution?

Might be better than having people ask if x-color is taken.

I know UTARC is going with Orange (although I had to get pink for my kids :-)).

I have been using yellow for the group that flies with me for the last several years and plan to use that color again this year. I don't find it to be a problem if others want to use the same color.

4155. Canon PowerShot A560 results

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-02 14:12:50 UTC
From: Mark Conner
Topic: 4155 Message: 4155

NSTAR Flight 08-A featured our first use of the Canon PowerShot A560 7.1 Mpixel camera using the CHDK firmware. Overall the results were excellent. The camera ran for the entire flight on one set of Energizer lithium AA batteries (the blue/silver ones). I shut the LCD display off prior to the flight to help with the battery life. According to the temp sensor in the payload the camera approached -15C in temperature but continued to function. I had sort of tested the cold operation capability of this camera during the lunar eclipse in February - it was about -10 to -12C that evening and I left it outside for an hour taking photos automatically.

The CHDK firmware (http://chdk.wikia.com) allows scripting of common camera functions, to include a customizable intervalometer function. Almost anything that can be controlled from the buttons on the camera can be included in the script. I had mine set to take full-resolution pictures every 20 seconds and got around 1 Gbyte of images during the 2 hours and 15 minutes the camera was active.

The firmware can be set to 'boot' from the SD card at power-up, and a default script can also be ready after the power-on sequence. This makes launch preparation very easy - power on the camera, turn display off, click shutter button to start the script. Best of all, this does not require any camera disassembly or any other permanent mods to the camera itself. The original Canon firmware is intact and the camera can be returned to normal operation by either disabling the SD card firmware load, or inserting another card that does not contain the firmware. I plan to keep the camera in my car for grabbing photos of severe weather or whatever. I've also experimented with making time-lapse movies using the intervalometer function and some JPEG-to-AVI conversion software and have been very impressed with those results too.

The camera will take SD High Capacity cards of 4 Gb or more, according to the manual. I used a 2 Gbyte card for this flight, which can be found for about $15-$20 now. It will also take AVI movies and the CHDK firmware reportedly allows movies of >2 Gbytes in length and I think a 4 Gbyte card would capture an entire flight if the frame rate or quality is reduced a bit.

The cameras typically go for $85-$100 used on eBay. I believe newegg.com still has some new or refurbed ones for around $125. I don't believe these are in production anymore, so if you want one don't dawdle too long.

I will have a full set of photos on www.nstar.org in a few days (when you have >400 to review, it can be tough to edit them down). We got several with the moon in the frame as it was setting in the west near our burst time. A sample image is on the website now.

If you are looking for a high-quality digital camera to fly on your payload with a minumum of integration issues, you can't go far wrong with the Canon PowerShot A560. Others in the A500 or A600 series should perform equally well. If you plan to use the CHDK firmware, consult the site to make sure your particular model is supported.

Thanks to someone in the ANSR group for posting the note regarding the CHDK firmware availability (I can't find the original e-mail right now) - without that note I would not

have known about this capability.

Mark,

What time-lapse editing software are you using?...I want to do a time lapse movie of my collection of photos from our last flight using the A560 and A570IS cameras...the one pointing up at the balloon is particularly interesting as the sky turns blacker and blacker as the balloon gets larger and larger.

Looks like precedents are being set all over the ARHAB world this month.

Greg

http://www.kwu.edu/publicrelations/stories/200708/balloonsp08.html

KWU Physics Club is going for altitude record
with upcoming balloon launch

MEDIA CONTACT: Leslie Eikleberry, Director of Public Relations,
785-827-5541 ext. 1127

April 3, 2008

The Kansas Wesleyan University Physics Club has its sights set high for its upcoming balloon launch.

The club plans to launch its third balloon at 8 a.m. April 12 in Martin Stadium. The launch is open to the public at no charge.

This time, however, club members hope their balloon will soar to a new amateur balloon altitude record, according to Dr. Susan McDonald, Chair in the Department of Mathematics and Physic.

?We are lightening up the load and going for altitude this time,? McDonald said.

She explained that the Physics Club members wanted to see what modifications they needed to try to break the altitude record.

?They are making two changes ? mass of the payload and the balloon lift. The balloon lift is determined by the amount of helium and the mass of the balloon including payload,? McDonald said. ?This is a good exercise in engineering for these students as they work on modifying their experiment and see the impact on the balloon altitude.?

In December 2006, the Kansas Wesleyan Physics Club, with the help of the Salina Ham Radio Club, launched its first high altitude balloon, which carried a payload consisting of a video camera, a temperature logger, and a GPS tracking device. The multi-faceted experiment was designed as a fun way for students to study the Earth?s atmosphere. Additionally, some of the University?s pre-engineering students used the experiment as their final design project. The group tracked the balloon from its launch at Martin Stadium to western Missouri, where the GPS signal was lost. With the help of Ham Radio operators, the balloon and payload eventually were found in a field in western Illinois.

In November 2007, the group launched another balloon, this time carrying a payload that included temperature probes, an accelerometer, a video camera, and a GPS transmitter. The balloon came down in rural Lyon County, a few miles northwest of Emporia. The project was able to gather data on location, altitude, and temperature both inside and outside the payload, McDonald said. The group was interested in the inside temperature because prior to the launch, a hand warmer was added to provide heat for the measuring instruments.

McDonald said the current altitude record for an amateur balloon is 120,522 feet set in March 1999. For more information about amateur balloon launch records, please go to http://showcase.netins.net/web/wallio/ARHABrecords.htm .

4159. SNOX V ATC Volunteers needed

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-05 05:58:28 UTC
From: Dan Bowen
Topic: 4159 Message: 4159

Hi DTRC listeners,
We are going to be in contact a lot with Air Traffic Control on this flight, and we could use a hand, as there are only 2 of us able to do it in the group so far. It involves telephoning ATC every 15 or 30 minutes to give position reports as presented on a certain web page. We need about 2 more people to split it up into manageable shifts. Please email me if you have experience with talking to ATC and would like to help! (we need some sleep after these weeks of construction!)
Thanks,
Dan

From: Greg Williams
Topic: 4161 Message: 4161

Received this in my inbox today:
Greg

Pardon my broadcast style, I've just posted a new blog entry regarding ARHAB and the current attempts to "float to Europe" via http://www.somenet.net ...

I'm hoping that this may help stir up some folks to listen for and contribute to the distributed telemetry gathering process ...

Feel free to comment and/or add links to the post, registration is not required. Good luck and good weather to the flyers ..!..

73 and thanks for your time /;^)

4162. Re: [Balloon_Sked] Launching large

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-05 22:54:34 UTC
From: K. Mark Caviezel
Topic: 4162 Message: 4162

Dan:
A look at the performance chart for your balloon indicates that you can collect and haul 7 lbs of ice to 10km float altitude if you get that much ice.

That would require 7+3.5(balloon) + 11.5(payloads) = 23 lbs buoyancy gross inflation to make that scenario come true.

7 lbs of ice is a layer only 0.036" thick on the entire cross section, but like I said before, the Global Western TA Balloon's pillow top design will likely shed ice off the top.

Admittedly your SNOX V will be the guinea pig, but I still recommend launch on schedule.

Pay heed to Robert's caution about super cooled clouds - you'll collect a TON of ice should you encounter those.

K3SPC located payload. Is on private property. Attempt made to contact property owner (not home).

Message left with owner on home phone and note on door.

Guess where payload is? It rhymes with "Pin a tree"...

They said it appears to have a lot of helium left in the balloon. he speculated half full, but it was being blown around in wind. Just below two peaks in a valley. Terrain is rough.

He will email pics to me and I will post them once I get them.

The WB8ELK balloon has landed near Lakeside TN (south of Knoxville)....it's transmitting on 14.103 MHz USB RTTY (center carrier of 14.105)....since the band is open, I was wondering if anyone can listen for it to see if we can get a final landing spot for it...it will continue to transmit until Sunday evening.

It reached a maximum height of 100,367 feet....had perfect copy on it throughout the flight and heard it down to about 18,000 feet here from 150 miles away. It was running 400 milliwatts.....the transmitter didn't seem to drift or flutter at all during the flight and even after burst.

The kids' sizes are fine. I just had my wife try on hers and it is "snug" for a size large. Normally the women's size large are just right or even loose on her.

She also has not washed it yet, so it might shrink even more.

So I would say it is an issue here as well.

All other shirts appear fine thus far. I haven't delivered one to its owner yet, though, but it's a men's large.

Thanks for the reply Greg. Two problems are enough for me to think that this is a trend. It seems that Zazzle is using Twiggy look-alikes for their sizing models. I'd encourage all the women planning on getting t-shirts to order at least one size larger than they normaly do. It might be a good thing to order x2 larger for the "babydoll" style.

Greg: Let your wife know that Zazzle has an excellent return policy, and helpful staff, imho. She should be able to call them and have that shirt swapped.

4183. Taylor University HARP - Upcoming launches

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-19 19:26:47 UTC
From: Patterson, David
Topic: 4183 Message: 4183

Taylor University's High Altitude Research Platform will be launching two missions in the next week:

Thursday, April 24: Launch from The Orchard School in Indianapolis, Indiana. Approx. 65 6th graders have constructed payloads - including the enclosures - ranging from digital cameras to stuffed animals "enhanced" with sensors. The flight will be flying Taylor's telemetry system for primary tracking, and the KB9ZNZ-11 callsign on the 144.39MHz APRS freq. Release is scheduled for between 8:30 and 9:00 AM.

Saturday, April 26: Launch from Taylor University's campus in Upland, Indiana. This launch features research projects from Taylor's Principles of Engineering class, and will be flying Taylor's telemetry system as primary, as well as the KB9ZNZ-11 callsign on 144.39MHz. This launch will also feature a cross-band repeater with 146.46MHz / 446.025MHz up/down. Release is scheduled for around 10 AM.

Feel free to let me know if you have any questions!

4184. Helium depletion

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-22 06:35:20 UTC
From: Mike Manes
Topic: 4184 Message: 4184

There's a rather alarming piece on P.96 of the May 2008 QST describing the projected depletion of the National Helium Reserve by 2016. Helium is not a renewable resource, and other than that reserve, the only known "new" sources are natural gas wells which mostly vent He as a contaminant.

Perhaps it's high time that ARHAB gets busy figuring out how to use hydrogen as a fill gas safely? I noticed that the price of our He T-bottles has soared from about $55 to nearly $80 in less than 2 years. Might be a swell topic for the GPSL 2008 conference.

From: Mark Conner
Topic: 4184 Message: 4186

If you're getting a T cylinder for $80, you're getting a pretty good deal. Full rate from Linweld is at least $100 - on my last trip there the guy cut it to $98 for me. I paid $105 at one point last summer.

Hydrogen is $40 per T cylinder at Linweld now, but requires 1-2 week leadtime to ensure they have stock. The Omaha store normally carries T cylinders of helium all the time.

NWS has used hydrogen for many years now for their upper-air observation program. The Topeka office has an upper-air observing station - maybe one of their meteorologists or technicians would be interested in giving a presentation on their safety procedures at GPSL 2008.

From reading their documentation online, they mainly ensure they're grounded for static protection and well-ventilated. Since hydrogen rises, any balloon rupture during the fill would quickly dissipate unlike other gases which might stay on the ground and pool somewhere. Because their UA observation building has a partially-enclosed space at the top, I believe their procedure if they have a balloon rupture inside is to open the doors and vacate the space for a period of time (30 minutes?).

I would think that the risk, while not zero, is pretty low in most ARHAB operations. In Nebraska, we normally have a dampness problem early in the morning and static is pretty unlikely. We also fill outdoors most all of the time. I think if you use standard precautions about flames or other ignition sources, one can use hydrogen safely. To further minimize the risk, spectators should be kept some distance away.

Tons of natural gas are transported daily without a problem.

Along with grounded hoses, be sure to use a metal filling pipe, you don't want to insert PVC plastic into a balloon neck and have dry hydrogen gas run through that.

And definitely fill outside.

Paul

Brazil Priest Carried Aloft by Hundreds of Balloons Disappears
Monday, April 21, 2008

SAO PAULO, Brazil — A Roman Catholic priest who floated off under hundreds of helium party balloons was missing Monday off the southern coast of Brazil.

Rescuers in helicopters and small fishing boats were searching off the coast of Santa Catarina state, where pieces of balloons were found.

Rev. Adelir Antonio de Carli lifted off from the port city of Paranagua on Sunday afternoon, wearing a helmet, thermal suit and a parachute.

He was reported missing about eight hours later after losing contact with port authority officials, according to the treasurer of his Sao Cristovao parish, Denise Gallas.

Gallas said by telephone that the priest wanted to break a 19-hour record for the most hours flying with balloons to raise money for a spiritual rest-stop for truckers in Paranagua, Brazil's second-largest port for agricultural products.

Some American adventurers have used helium balloons to emulate Larry Walters — who in 1982 rose three miles above Los Angeles in a lawn chair lifted by balloons.

A video of Carli posted on the G1 Web site of Globo TV showed the smiling 41-year-old priest slipping into a flight suit, being strapped to a seat attached to a huge column green, red, white and yellow balloons, and soaring into the air to the cheers of a crowd.

According to Gallas, the priest soared to an altitude of 20,000 feet (6,000 meters) then descended to about 8,200 feet (2,500 meters) for his planned flight to the city of Dourados, 465 miles (750 kilometers) northwest of his parish.

But winds pushed him in another direction, and Carli was some 30 miles (50 kilometers) off the coast when he last contacted Paranagua's port authority, Gallas said.

Carli had a GPS device, a satellite phone, a buoyant chair and is an experienced skydiver, Gallas said.

"We are absolutely confident he will be found alive and well, floating somewhere in the ocean," she said.

"He knew what he was doing and was fully prepared for any kind of mishap."

4189. helium... hydrogen

Posted by: "Mike Manes"
mrmanes@...
w5vsi2002 Mon Apr 21,
2008 10:35 pm (PDT) There's
a rather alarming piece on P.96 of the May 2008 QST
describing
the projected depletion of the National Helium Reserve
by 2016.

>>>>> I'm certain that helium will be commercially
available in 2016 and beyond. The US National Helium
Reserve is a cold war vestige, uneconomic, and being
shut down by order of Congress. From Wikipedia:

"By 1995, a billion cubic metres of the gas had been
collected and the reserve was US$1.4 billion in debt,
prompting the Congress of the United States in 1996 to
phase out the reserve.[1][2] The resulting "Helium
Privatization Act of 1996" (Public Law 104?273)
directed the United States Department of the Interior
to start liquidating the reserve by 2005.[3]"

And regardless of what happens with US domestic
production, Algeria has emerged as a helium supply
powerhouse in the last decade.

The price of helium is subject to manipulation by
suppliers- particularly those supplying small volume
users who usually have limited knowledge or
negotiational power in the marketplace. I have paid
as little as $35 and as much as $85 per T bottle of
helium in the last eight years. Another factor is
location- EOSS is well positioned, close to west
Kansas, the helium production center of the USA.

Use of hydrogen is not a bad idea - my local weather
station uses hydrogen for the 60 or so RAOB balloons
they put up every month. And they fill the balloon
indoors, in a purpose built facility.

Alarmingly though, in this insecure post 9-11 world,
users of hydrogen gas may face increasing scrutiny or
governmental roadblocks. At my day job, we recently
needed some gaseous hydrogen and the supplier sent TWO
men down to inspect our operation before sending out a
bottle.

Hydrogen is routinely used in Europe for manned 'gas ballooning', the extremely high cost alternative to the already expensive sport of hot air ballooning. Of the twenty or so gas balloons launched from the Albuquerque International Balloon Fiesta every year, about 1/3 of those are filled with hydrogen. I crewed for a hydrogen gas balloon at AIBF in 2005 and was really NOT impressed with the level of compliance with normal safety protocols.

Further reading:
Gone with the Wind: a manual for gas ballooning by Astrid Gerhardt
and
Flammable Gasses, by Frank Overs.

The first one is hard to get and rather expensive, the second one is available from the Balloon Federation of America if you call the main office.

best regards,

- Mark Caviezel

4190. BASE 22 - Launch site change for tomorrow's flight

Topic: 4190 Message: 4190

Dear all,

Although we seem to find trees in the middle of 400
acres of corn or beans, and on the one year
anniversary of cutting down two 90 foot trees to
recover our payloads on Earth Day last year, the
launch site for BASE 22 is being moved to Greencastle,
Indiana. Launch time remains 12:15 UTC tomorrow
(Wednesday the 23rd) and the predicted landing zone
will be within 20 miles of Hope, Indiana.

Thanks for your support,
Howard

Of course you all by now know my thoughts about Hydrogen, (Near Space Sciences)

But you need to shop better or something. we get these size tanks for at the most 28 bucks, and depending on who is behind the desk that day as cheap as 14 bucks.

if they ever told us 40 bucks we'd walk away saying keep it.

Thanks, Joe.

The QST article presented much of that same material. Kinda makes pix of the bursting balloon take on an whole new meaning, doesn't it?

Anyhow, all that's keeping many ARHAB groups, EOSS included, from adopting H2 as a fill gas is the safety question, not to mention the white-knuckle "Hindenberg" image. A lot of those concerns may be allayed, however, as we make our snails-pace progress towards a hydrogen economy. Sooner the better - Helium's getting pricey!

How is H2 running thru a PVC fitting more risky than H2 running thru
a latex neck?

And how does one ground a hose?

The hose has a metal mesh in it from what I've seen at the NWS. Perhaps it's time I visit the local welding shop.

My impression (right or wrong) is that a thick PVC pipe will generate more static from a dry gas flowing through it than a latex balloon. If that's wrong, then PVC should be fine. I'll have to look at some old pictures, but I believe the NWS uses a metal filling tube.

Many amateur radio balloon groups have been safely using hydrogen (and saving money) for quite some time. One group that I fly with uses hydrogen exclusively. When dealing with high pressure tanks one needs to be safe regardless of the type of gas contained in it.

4205. BASE 22 - successfully completed

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-23 20:34:17 UTC
From: BASE
Topic: 4190 Message: 4205

Dear all,

BASE 22 was a smooth flight today. Launched 3 minutes
early at 12:12 UTC. Maximum altitude - 100,800 feet.
Average ascent rate - 850 feet/minute Landing about
six miles north of Hope, IN in Shelby County.

Additional details at:

http://www.depauw.edu/acad/physics/base/pages/base22.asp

The APRS radio kicked out at 58,000 feet (I still need
to work out air infiltration), but the 900 MHz spread
spectrum held steady throughout the flight. Watched
the last two-three minutes of descent from 500 yards
to the west of the landing point. Unfortunately, we
were on the wrong side of the property to get
permission to enter and attempt a catch, but that's
probably just as well for my health.

Thanks for your support. Hope see you at GPSL in
Liberty, MO.

Subject: Re: [GPSL] EOSS Intervalometer Question

You might try avoiding the full reset. If you don't mind verifying settings prior to launch, just set your camera for ISO, focus, etc., manually and then start the script which only handles the picture-taking function.

Here is my script for the Canon A560 (not well documented). The 'set prop' commands are probably unique to each model. In these, I'm setting 'flash off', ISO 400, and some other things that don't seem to work and/or I can't recall now what they're supposed to do. I've got better docs somewhere else.

From: Mike Manes
Topic: 4184 Message: 4209

Ach du Leiber! Der Hindenberg Effekt!

Actually, hydrogen burns a lot more safely than carbon-based fuels in that there's very little IR radiation. In fact, the flame is nearly invisible - but it's VERY hot! Water, the combustion byproduct, is not anywhere close to a black body radiator. The blazing flames one sees in the movie of the Hindenberg disaster came not from the hydrogen but from the rubber gas bags and fabric skin covering the dirigible's framework.

Yes, H2 is certainly combustible (duh!), and in the presence of atmospheric oxygen, an otherwise innocuous static discharge spark can ignite the mixture. Anyone close to the balloon will likely be burned by IR radiation from the burning latex, but the hydrogen flame will ascend rather than dispersing laterally. So it may be a good idea for the balloonmeister and any balloon handlers during a windy fill to don protective garb. Of course, all means available to avoid ignition should also be in place, including means to prevent static accumulation.

I'm no expert on this, but these steps appear to be reasonable first steps. Those who know the ropes more thoroughly and who are experienced with hydrogen balloon filling are certainly invited to chime in.

Tim - Just to let you know...I had to return mine and there are instructions under zazzle.com/support for how to handle returns. They make it very easy for you.

There is an email contact to obtain an RMA # for the return.

They send you that and a link to print the return shipping label.

I re-taped my original package, slapped the new shipping label on it and dropped it in the nearest UPS box.

They got the shirt back to me in record time, imho. Only problem is that it is an XL (i usually wear a L) and it is still too small.

We will probably want to look at alternate companies next year.

Hope everyone has better luck with this than i have had.

Mike - I agree it would be an awesome topic for GPSL in light of what has been happening with the prices. Would you be willing to lead a discussion on it?

We have been discussing tests with hydrogen a lot at our Near Space Ventures monthly meetings and it would be good to share everyones information and viewpoints on the topic.

It seems there have been some tests done that indicate that it is a much safer process than previously thought.

Thanks for bringing it up. I would love to hear the rest of the group's opinion on the validity of this discussion at GPSL 2008.

As I have been saying for almost 20 years.

it is in no way as dangerous as it's made out to be.

many times after a flight when we are all done with the flight and are sttting around having pizza and beers, probably 505 of the time we have taken the remainder of the tank and filled trash bags, tie a string that has been soaked in charcoal lighter fulel or even better diesekl fuel, that is about 20 feet long or so,

light it and let it go, and make maybe a 1/2 dozen "Himdenburgs"

It does NOT,, read that word NOT explode in any way, 99% of the time you dont even hear anything, you just see the trash bag burn. thats all.

In all honesty the first time we did it we all were extremely let dow as to the boringness of the massive explosion we wre waiting for.

4214. RE: [GPSL] EOSS Intervalometer Question

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-24 05:40:05 UTC
From: Rick von Glahn
Topic: 4206 Message: 4214

Unfortunately, I☐ve passed the camera on to a packaging designer so can☐t do any testing to include a fix to set the camera in superfine mode. But, it☐s pretty easy stuff. You can control just about every button on the camera so a disp push a few down arrows presses and so on should return the camera to superfine mode. But, it is NECESSARY that you have the camera in hand so you can debug the script and thus, it☐ll be a while before I can look into this.

I built that script to reset the camera because I needed to absolutely sure of the state of every button and switch when the script executed. I will NOT be at any EOSS launch that flies the camera and so the idea was that anyone who could press the power on button would be trained and qualified to set up the camera for operation. If you are on scene at launch you might consider removing the reset sequence and doing that yourself. Frankly, I☐d recommend you figure out exactly how you want to fly the camera, sit down at the computer and write a script to do it all with one power on button press. It is actually quite fun to write the script, load it on the SD card stick it into the camera and execute it.

EOSS☐s launches are VERY hectic. More often than not there are two flights going up within 45 minutes of each other, each on a 3000 gram balloon. Folks are busily simulating the chicken sans head. So, why bother having to set something up in the hectic run up to launch when you can have it totally automated.

And, as an emergency backup, you might consider installing a much more vanilla intervalometer script in the script directory. If you decide at launch that you want to do something totally different as far as settings go, you could reset the camera, set all the options manually and then execute a script that only handles the sequence of taking photos. Our camera has that simple script on the SD card but I doubt it☐ll ever get used as whoever will be preparing the camera will likely only be instructed to turn it on and secure it inside it☐s payload container.

When I next see the camera I☐ll be changing the script to do exactly what you want. Can☐t believe I let the average jpeg compression slip in there. Minimal compression definitely should be implemented to attempt to resolve tiny details on the ground. So, my apologies for missing the obvious.

I saw the results of a gas cylinder in the chemistry lab that had fallen over and had the valve knocked off...it went through one cinder block wall and halfway through another one. A friend in Berkeley, CA would sometimes go down to the shipyards when he was in high school and put a gas cylinder he'd find after the ship welders had left for the day and put it in SF bay...he'd whack the valve off with a sledge hammer and the thing would streak across the bay like a torpedo...which it would've become had it hit any ships.

The moral is to always strap down your tank when the cap is off or lie it on the ground while using it.

As to hydrogen ignition....here's a good website showing the results of their attempts to successfully ignite a hydrogen weather balloon of about 4 feet in diameter....with some nice photos of the results.

Rick,

I surely didn't meant to fat-mouth your script. I think it's a wonderful addition to the info. out there for balloonists. I certainly understand why the reset.

I'll keep playing with it and try to figure out how to manually change that setting after starting the script. Yesterday afternoon was the first time I tried anything with this CHDK stuff and trying to wrap my head around all of it at once was, well, a bit much for this non-computer, non-tech guy. As far as me writing a script? - not likely. I have no skills, experience nor real desire. But I really do appreciate you making your labors available for the rest of us! Thanks!

Pete

It seems soo funny after in 5 months it will be 20 years of preaching these facts, to absolutely deaf ears and EVERYONE constantly preaching the "Hindenburg" effect. It got to the point, that I just gave up, and thought to myself, "Whatever dudes, go ahead and spend your 80+ bucks on a tank and I'll just go down the road with my 14 buck tank".

Last comment on the Hindenburg thing anyway, Hello it burned, it did not explode. and 99% of the BURN was NOT the hydrogen but the containment bags, and Mostly the totally stupid covering. Quote,

What we now know.

As we all know the wide spread belief/myth is that hydrogen is to blame for the 37 dead, but there is new evidence to discredit that theory. A NASA scientist at Cape Canaveral has discovered the real cause. "Neither the hydrogen in the hull nor a bomb was to blame, but a special fabric for the outer skin that, when ignited, burns like dry leaves."

Bain's suspicions of the Zeppelin's fabric covering were raised when he learned that a cellulose nitrate (gun powder) dope with powdered aluminum (fuel) was used on the Hindenburg. He was able to obtain a 60 year old piece of the fabric used to test his hypothesis. Furthermore, a hydrogen flame is almost invisible in day light. We know from many eye witness accounts as well as actual photographs, that the flames were red and orange. This supports his theory that hydrogen was not the source of the flames.

He was able to prove his theory into fact, and the plaque in the Kennedy Space Center has been changed reading a more accurate portrayal of the history of the Hindenburg. Scientists now agree that the outer covering was ignited by static electricity. It would appear that the Germans agree with them in their claim. German electrical engineer, Otto Beyersdorff, on 28 June 1937 wrote "The actual cause of the fire was the extreme easy flammability of the covering material brought about by discharges of an electrostatic nature." Furthermore in California in 1935, a helium (non combustible gas) filled airship went up in flames as well.

Interesting huh?

Even if you do have all these components electrically connected and
grounded, via the grounded tank, wired hose etc. what do you do about
the balloon itself? this is where all the gas is yes? yet you can't
ground a latex or PE balloon,, BOTH are excellent insulators. so this
grounding of everything what are we thinking we are accomplishing, where
the main part we are worried about exploding is not actually grounded.

> and launch in a clean
>area away from other people, buildings, and vehicles.
>
99.9% of our balloon fillings are done indoors in closed draft free areas.

>
>
We have actually gone the opposite direction. for reasons that I will
explain shortly. And the reasons explained herein.

Our filling system is totally floating (electrically) from ground.
NOTHING is grounded. and we do this on purpose.
Why, as this seems to go totally in the wrong direction of common thought. Part of our thinking actually came from two places.

1- Was from a local radio station here. There is a local FM broadcast station here, and, they were every year having horrible problems with lightning.
what is lightning? It's just a strong bit of electricity right?, That wants to equalize, between the two potentials, and it looks for the path of least resistance right? We all know this. This station over the years has spent hundreds of thousands of dollars on state of the art lightning protection equipment. As well as countless dollars replacing damaged equipment. No matter what they did they kept getting nailed. They even got to the point where they had actually more invested in the stations lightning protection system than the transmitter itself! and every year they'd get nailed. till oh,, probably , geez i can't remember when, but after they got nailed by a real massive strike. they were at the point of shutting the station down, and give up.

One rouge engineer (old retired guy) asked them if they were willing to try one radical solution. For one last hurrah so to speak, and in the industry a extreme radical thought that goes AGAINST the whole community and standards practice. The owners said what's the idea, and this one old guy that was NOT even a part of the station at all, (the owner actually met him at a local bar!) told him some basic static electrical theory, and of course this did not please the owner he's heard this stuff from all of the "Professionals" already a hundred times. But then this old fart told him, what's happening, the spark is trying to find the path of least resistance to equalize the voltages right? he said yeah (again heard this a thousand times) So the old guy says take the path of least resistance away. HUH? He told him isolate EVERYTHING! totally float EVERYTHING from ground. have nothing grounded in ANY way, EVERYTHING no matter how small, but totally float everything! He explained in doing this the "Path of least resistance" is no longer there and the lightning will look for a better path to ground. since this path is now totally invisible to the lightning, It just plain does not exist. In a strange way it made sense. They have tried every other thing, and they spent several months setting up the station to "Float" Guess what the station is still on the air, and hasn't had a single hit in over ten years now. Where before, they were getting hit at least once a month. if not more.

2- Where i work, they had a huge static electricity problem. We Make large polystyrene sheets for the advertising industry.
Polystyrene in itself is a pretty good insulator, but when you slide one 4 foot by 8 foot sheet from the machine producing the sheets onto the stack, it generates a incredible amount of static. yes the current is like zero, but we have measured the static potential at times into the mega volt ranges. I have seen lightning bolts come from a stack jump to a person walking by over 4 feet away, and just lay them out on the floor!

This company also tried every grounding thought and static control company there is. but with little success. Yes it did help don't get me wrong, but the problem was still there. for a major part of the problem, how do you ground a insulator? Poly styrene is a pretty good insulator.

POLYSTYRENE: A insulator with superb dielectric properties. Polystyrene capacitors exhibit little dielectric adsorption and virtually no leakage. Liquid polystyrene or Q-dope is a low-loss coil dope used to secure windings and other components in RF circuits.

Till again they learned what happened at that radio station, and decided to try to "Float" the whole area, so the static buildup can not find a way to ground. Guess what it worked! there was never a spark to be seen or felt from any of the workers from that day on.

So here at NSS when we set up our inflation area, we isolate the whole system,

first down is a old heavy blanket, just to keep any potentially pointy thing from happening, then we lay a plastic tarp on the blanket, on this is laid a thin PE sheet similar to a drop cloth,
then the tank is laid on this along with it's connected regulator,. the hose from the regulator is a 1/4" id, latex tube, that connects to a 1.25" od PVC coupler, which the balloon is attached with a stainless steel hose clamp.

so the whole system is insulated from the ground many ways. 45 official flights, and probably as many again non official, using this method, in all sorts of weather from 100 deg with 100% humidity, wi cold 20 below and 5% humidity days, NO PROBLEMS and no static potential whatsoever, we have tested it with the e static potential equipment from work. think,, static wants to go to ground, don't give it a route, and you have no path, no path,, NO SPARK> simple

Joe & NSS

4223. NearSys Updates

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-24 18:53:51 UTC
From: PAUL VERHAGE
Topic: 4223 Message: 4223

I've started ripping video from DVDs and have an example on my website, NearSys.com under Other Multimedia. I think I have everything down (except for Vegas) to begin working on a movie I've wanted to do called Near Space Nation. The two movie clips are some examples of what I'd like to add to the movie.

Now to find information on using copyrighted music before they send me to jail.

Paul

4224. RE: [GPSL] EOSS Intervalometer Question

Subject: Re: [GPSL] EOSS Intervalometer Question

Rick,

I surely didn't meant to fat-mouth your script. I think it's a wonderful addition to the info. out there for balloonists. I certainly understand why the reset.

.snip.

4225. Re: [GPSL] Re: Helium depletion

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-25 19:22:26 UTC
From: Mike Manes
Topic: 4184 Message: 4225

Thanks Mike!

Seven T-bottles of He just about does the job for a two-fer 3000 gm launch, and about all that we can fit in a large pickup. For smaller vehicles, we borrow a trailer to carry the gas. Since H2 yields a little more lift, then 7 T's should give us a bit more margin.

BTW, Don WA9WWS has volunteered to gather all the pertinent pointers related to EOSS's switching over to H2, so be sure to keep him in the loop if you have any further excellent input such as this. He's cc'ed above.

Hope you've been able to get out on a few flights there in 4-land - there are gobs of new groups coming aboard - consuming what little He is left :=}.

And EOSS-127 ended up with a much smaller student payload weight than we'd anticipated - only 12.3 lb vs. the 20 lb typical for that type of flight. So it just took a bit more than 2 T's to get a good fill.

4226. WB8ELK balloon will launch around 1:45 pm CDT - use DTRC for RTTY reception

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-26 17:57:59 UTC
From: wb8elk@aol.com
Topic: 4226 Message: 4226

Launch will occur after the ozonesonde....probably between 1:45 and 2:00 pm CDT.

10.142 center carrier...best RTTY/Hellscreiber receive is 10.140 USB for 2000 hz tones.

This could be a long duration latex flight if it achieves float.

If you have the UTARC's DTRC program....go ahead and use it and we can see each other's receive on RTTY.

http://dtrc.utarc.org/dtrcpeek.php (http://dtrc.utarc.org/dtrcpeek.php)

Also...the SNOX chatroom will be monitored during the flight.

http://dtrc.utarc.org/chat.html (http://dtrc.utarc.org/chat.html)

4227. WB8ELK balloon still flying - Hellscreiber mode only

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-26 23:01:24 UTC
From: wb8elk@aol.com
Topic: 4227 Message: 4227

Still flying near Chattanooga, TN at 92,000 feet...will be up in the air for awhile longer..

RTTY is not working...just steady carrier...however, Feld-Hell is working fine.

10.140 MHz USB.

- Bill WB8ELk

**********Need a new ride? Check out the largest site for U.S. used car listings at AOL Autos.
(http://autos.aol.com/used?NCID=aolcmp00300000002851)

4228. WB8ELK is floating at 105k feet - may be up all night long

Yahoo group: GPSL (2002 — 2008)
Date: 2008-04-27 02:05:37 UTC
From: wb8elk@aol.com
Topic: 4228 Message: 4228

Live chat about the ongoing long duration flight:

http://dtrc.utarc.org/chat.html (http://dtrc.utarc.org/chat.html)

Update: 0157z:

Been floating around 105,000 feet for a couple of hours now....the RTTY portion is not working for some reason but the Feld-Hellscreiber is working great.

Maximum altitude was 32882 meters....since then has been hovering around 32000m (105,000 feet or so) for the last few hours.

This was a test to intentionally vent helium with a 1/16" hole in a PVC pipe fitted into the nozzle....it seemed to have worked great.

It may be up all night and possibly tomorrow as well.....check it out at:

Best tuned in at 10.141 MHz USB (will put it around 1 khz tones)....it is shifting around up and down about 500hz however...sounds like a weird slow MFSK mode followed by the on/off keying of Feld-Hellscreiber....once per minute.

Some downloadable programs to receive Hell: MixW (free limited time eval)...MultiPSK....and a dedicated Hell program from IZ8BLY:

http://xoomer.alice.it/aporcino/Hell/index.htm (http://xoomer.alice.it/aporcino/Hell/index.htm)

Should be up for the night hovering around Chattanooga, TN at the moment at around 105,000 feet....not traveling very fast...only a couple of knots ground speed.

- Bill WB8ELK

Hi Deb,

Not sure I'm gonna make GPSL this year. But one of our long-time members, Don Fraser WA9WWS out of Colorado Springs CO is gathering pertinent info for EOSS, and he plans to make GPSL for the first time this year. He's also agreed to talk on what he's learned and perhaps to host a forum on the subject. Contact Don directly - he's cc'ed above.

4231. Helium Order Estimate

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-04 20:10:15 UTC
From: dlkaiser23
Topic: 4231 Message: 4231

We are attempting to get an idea of how many bottles of helium are needed for GPSL.

The situation is this:
We don't know what the price may be, but think it will be somewhere around twice the cost it has been in the past.
We are not sure we can find a source for as much as we will need, but we are in the process of researching this and have a new lead to follow up on.
We need to know how many bottles you would like to have available for your use.

Please respond to this email with your name, your group and the number of bottles desired. I
will track this for Troy who is trying to locate a source for us.

Thank you.

Dear Deb,

BASE - DePauw would like to have access to two tanks,
but probably won't use much, if any of the second. In
a pinch, we could reduce payload.

Thanks,
Howard

P.S. - You might check with the folks at Jewell. If
someone in Chem, Physics, or Bio, regularly uses
helium, they might be getting a very good price and
could up their order.

Hi Bill,

Here's a pretty good source for some of your questions:

www.faa.gov/aircraft/air_cert/design_approvals/uas/reg/media/uas_guidance08-01.pdf

You may have to paste that URL together.

The short answer appears in that document under 3.0 Definitions for UAS.
It's gotta have 3-axis control, so MAYBE a steerable 'chute is exempt. I'd
sure think so, since it's no more a threat to civil aviation than is a
conventional one. But then, I'm not the .gov.

BASE 23 was successfully completed today with an
exciting end of flight impact.

Launch from Greencastle, IN - 12:45 UTC

Burst Altitude - 82,300 feet

Landing - downrange 78 miles heading 93.3 degrees

Payloads never hit the ground. The flight string -
three boxes below the chute was intercepted by a large
truck carrying mulch traveling east on US 52 at
highway speed. The APRS radio (which failed in post
burst chaos) landed on the hood, the experiment pod
was on the front grill, the command pod - flight
radio, computer, and 900 MHz spread spectrum radio was
on the roof, and the chute and balloon in the bed of
the truck. Thankfully the driver maintained control
of the vehicle and called to report the recovery.
Having left Greencastle fifteen minutes after launch
we were about eight miles from the system at the
moment of impact.

All pods seemed unfazed by the event. The driver's
beagle continued to bark at the boxes until we met.

It was an exciting end to our twelfth flight of the
school year.

More details to follow on the website:

http://www.depauw.edu/acad/physics/base

BASE 24 is scheduled for 18 June.

IIRC, this is only the 2nd ARHAB / highway collision on record.
Congrats on the recovery, and thank goodness the outcome was
benign. It also serves as a testimony for including "phone home"
and "return to sender" info on the payloads and designing 'em
to survive a rough landing.

Dear friends,

Here are some additional details about the impact of BASE 23 and the mulch truck.

There was no damage to the truck. All three pods were foam core construction (either two inch or one inch thick) with the payload region cut out from the middle of each piece leaving a solid perimeter. The pieces were bonded by 2 hour epoxy. Total payload mass was 2.5 kg (weight of 5.5 lbs) the two radio pods were each 0.75 kg and the experiment pod was 1.0 kg.

Impact was on the broad side of the APRS radio pod where the weight density is 1/8th of an ounce per square inch (the narrow side is 3/4 of an ounce per square inch).

The parachute was a 6 foot Spherachute and the vertical descent speed was 15 +/- 2 mph below 30,000 feet. Surface winds at the moment of impact were almost identical from the southwest.

Staying significantly below the safety guidelines (weight density less than 3 ounces per square inch on the smallest cross sectional side) made the collision structurally inconsequential.

The bigger issue is driver distraction, which was not a problem in this case. However, the traffic density on US 52 at that time of morning was no more than one vehicle per minute in either direction on the two lane road. The light traffic explains why no one else witnessed the impact.

Subject: [GPSL] Helium Order Estimate

We are attempting to get an idea of how many bottles of helium are needed for GPSL.

The situation is this:
We don't know what the price may be, but think it will be somewhere around twice the
cost it has been in the past.
We are not sure we can find a source for as much as we will need, but we are in the
process of researching this and have a new lead to follow up on.
We need to know how many bottles you would like to have available for your use.

Please respond to this email with your name, your group and the number of bottles desired. I
will track this for Troy who is trying to locate a source for us.

Thank you.

George Flinchbaugh WA8HDX of Findlay, Ohio passed away after 20 days in intensive care for heart bypass surgery...he was 87.

I'm glad I had the chance to do one more balloon event at his farm last August to celebrate the 20th anniversary of the first flight in 1987 that was launched from his farm. He was a great friend and an avid supporter of our balloon efforts offering his farm and ham station with welcoming arms for over 20 years.

We are not pushing one place over the other. The only consensus seemed to be 'we want to stay where we want to stay'. All of the conference will be over at the college so we won't really need the facilities of a hotel or motel.

Hope this helps a little.

Dear friends,

The landing, and the flight, made the local paper in
Rushville. The only significant factual error is that
we did NOT have a visual on the descent, only a radio
signal. We were delayed en route to the destination
by a highway striping paint crew and road construction
in Rushville.

Here is the link to the article:

Dear Harry,

I stayed at the Super 8 in the fall of 2006 and had no
problems. It is the oldest of the motels on the list.
It is also slightly closer to campus. The others
are on the other side of I-35 (a whole half mile
farther).

As an Scouter, I don't have too many complaints about
any indoor facility, especially with indoor plumbing!.
I will let my colleagues choose where we stay for
GPSL.

4257. Alaska First Balloon Flight A Success

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-11 19:40:33 UTC
From: powellite52
Topic: 4257 Message: 4257

Hi all;

I just wanted to thank all of the folks who have given me advice, tips, direction and suggestions - making our first (ever) flight a breathtaking success.

After several months of preparation, we launched the BEAR balloon flight #1 yesterday morning (Saturday May 10) at 10:09am and watched in awe as it went to 95,170 feet before burst and subsequent descent.

Our initial flight planning included an airplane intercept with on-board GPS/Radio tracking gear operated by two ham radio operators who tracked the descending balloon and overflew the exact impact location.

Although we originally thought recover would be impossible, we were thrilled with a near vertical ascent and descent with the balloon package landing about 12 miles away and within 4-wheeler reach. Within the next week, we are anticipating recovery of capsule 3 which included a still camera set to taken pictures every 3 minutes as well as a data logger.

I will post data, ground and air video and data as they become available on the Bear web site (http://www.bear.437am.com/)

Now that we've successfully tested the BEAR balloon template, we anticipate using a portion of the future flights for testing the University Of Alaska's "Cubesat" packages and several ham radio experiments.

Congrats on a successful first flight! Seems the stratospheric turnaround happens a lot sooner at the higher latitudes than down here in the lower 48. Keep up the good work, and hope to hear about more flights soon.

Chris,

I'm not sure about the C5 radio. I've only modified a C1 & C4.
I think Mike W5VSI is the one that came up with the hack.

What say ye Mike?

FYI - Mike may not monitor this Forum so I posted it to the GPSL Forum also.

Hi Harry,

No - not on balloonatics reflector - too many already! So you'll have to forward this to Chris if he's not on GPSL.

Sure wish the GPSL reflector would TURN OFF the forced Reply-To PITA feature. No clue how to contact Chris offline :={. So I'll bore all of you with this reply.

Hi Chris,

The coax installation for the DJ-C5 is per the variation instructions at the top of the page that Harry gave you the link to. And I have to use binocular magnifiers with a welder's helmet strap to do this work any more myself :={. I got mine cheap from Harbor Freight - or you can use an eye loupe or a magnifying desk lamp - essential tools for working on modern radios, especially for those of us who started out using a Weller solder gun for everything - even 1/4W axial carbon comp resistors on octal socket pins.

The solder bridge is evident by the fact that it stands higher off the board than other SMT connections, and it's not associated with any other components. Touching it with the clean tip of a 310C iron should pull the solder right off, leaving the two adjacent pads visible.

The solder bridge connects the 50-ohm antenna I/O from the radio to the input of the built-in dual-band matching network - the same function served by the blue jumper in the DJ-C1. Removing that bridge isolates the matching network so one can apply a 50-ohm load via coax. You'll know you done good if xmit output power is about 350 mW with +5.0V dc external power applied in place of the Li-ion battery (batt terminals also go straight to the 2 recessed charger input pins in the back of the radio.)

Hope that helps. Now that I have a digital camera, I could shoot a pix of that area of the board when I get that payload torn down next.

4261. HAPB3 Flight

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-12 23:37:49 UTC
From: Earl Foster
Topic: 4257 Message: 4261

Today was a successful day with my HAPB-3 launch. There were several moments of excitement during the descent when it looked like it was going to land in the middle of the Richland Creek Reservoir. That fact that it was traveling east at 100 miles an hour for ~20,000 feet pushed HAPB beyond the body of water. Just when we thought we were clear a 30 mph NW wind pushed HAPB to the edge of the reservoir - SPLASH DOWN! Park rangers and a nearby fisherman helped retrieve the payload.

Max Altitude: 103,274 feet

Images are available: http://www.hapb.net/HAPB3_files/images/index.htm

Still working on the in-flight data and video. I should have it uploaded in a couple of days.

There are definitely issues with the ladies shirts being non-standard sizes. I would make sure to check the size chart for any shirts you are ordering.

As far as a pocket goes, just look through all the styles. I am not sure if there is one there that has a pocket or not.

Hope it goes well for you. I have had to return and reorder, so i hope this isn't a common problem.

4266. Earth-balloon-balloon-earth test this Saturday

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-14 20:57:17 UTC
From: Mark Conner
Topic: 4266 Message: 4266

NSTAR and Near Space Sciences are planning a voice EBBE setup with their respective balloon flights Saturday morning. NSTAR will launch from the Omaha area and NSS will launch from Baraboo WI (northwest of Madison). Launch time should be around 1300 UTC (0800 CDT). NSTAR will have a simplex 70cm repeater and NSS will have a 70cm/2m cross-band repeater.

Bill WB8ELK plans to try contacts from the Dayton Hamvention. We'd also like to scare up some users to see if we can maximize not only our distance but opportunities for EBBE QSOs over a shorter range. Ideally we'd like operators in the following locations:

Central/western Nebraska
North-central Kansas
Northern half of Indiana
Western parts of Lower Michigan

Users closer to NSTAR will be using 70cm, probably 446.30 MHz. NSS users will be on a 2m uplink (freq TBD). Another message will be posted when frequencies are determined.

The ideal time to try will be 60-90 minutes after launch, or 1400-1430 UTC.

E-mail me if you plan to participate and/or have questions.

Hi Mark,
Joe Here and NSS,,

Ok freqs look good,, No Birdies here,, so the 446.300 is a go, and
on our end 144.325/446.300 BOTH WAYS!
How set in concrete is the 8 am CDT launch? I thought it was at first
going to be at 9?
I havent heard back from the scouts if 8 would be ok or not, Having to
co-ordinate several hundred Boy& Girl scouts is fun!

More info for everyone,
We here at NSS will have also a chat room running during the flight.
Hopefully it wont get attacked like the one from Bill's mission last
weekend.

It shouldn't it's not using IRC it's a private one I made for a web
site I made for a friend, the chat room is at,
http://www.roatanbruce.com/chat.html

We also will be running a mission net / amateur radio demo for the
scouts on 40 meters, starting at 7225 and up (QRM)

Take care

Joe WB9SBD And Near Space Sciences

Mike,
Thanks, I am very pleased with the outcome of this flight and the pictures and video.

The capsule is a Styrofoam cooler with walls 1.5 inches think and a wide base so it is naturally buoyant. The video lens hole is located 4.5 " up from the bottom and the camera lens hole is 6" up from the bottom. It landed flush on its bottom in a fairly calm body of water so that made the difference. I designed the 3 tier electronic housing structure with the heaviest items at the bottom so when it was installed inside the capsule the center of mass would be near the bottom but even that sits about 2 inches up from the bottom. I would like to think it was because of my design but it was probably just dumb luck.

4271. NSTAR Flight 08-B - Saturday, May 17th

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-15 13:58:11 UTC
From: Mark Conner
Topic: 4271 Message: 4271

Nebraska Stratospheric Amateur Radio (NSTAR) Flight 08-B is scheduled for Saturday, May 17th, at 0800 CDT (1300 UTC). Launch site will be the parking lot of Treynor High School in Treynor, IA.

A unique feature of this flight will be an attempt to complete a voice Earth-Balloon-Balloon-Earth (EBBE) QSO. The NSTAR balloon will have a voice simplex repeater on 446.30 MHz. Another balloon, Near Space Sciences, will launch from Baraboo WI at 0900 CDT with a cross-band repeater on 446.30 MHz/144.325 MHz. Users near the NSTAR end (western Iowa/Nebraska/Kansas) should use the 446.30 uplink, while users near the NSS end (eastern Iowa/Wisconsin/Illinois/Indiana/Michigan) should use 144.325 MHz. Please allow time between transmissions for the simplex repeater to record and then retransmit your QSO and keep your transmission short (10 sec or so). If all goes well, QSOs from central Nebraska to possibly as far as the Dayton Hamvention may be possible.

APRS will be on 144.36 MHz with callsign N9XTN-11 and on 144.39 MHz with callsign N9XTN-12.

Due to the wind forecast, NSTAR will arrive and prepare for an 0800 CDT launch time. If the surface winds are quiet, we will hold our launch as close as possible to 0900 CDT to match up with the fixed NSS launch time. If the wind begins to come up, we will launch prior to 0900. Total flight time will be about two hours, with a maximum expected altitude for NSTAR of 95,000 ft.

The high school is easy to find and is well-marked from Hwy 92 going through Treynor. Go south at the sign for the high school and the parking lot is on the south side of the school building. We will be monitoring the SW Iowa ARC repeater in Council Bluffs on 146.82- and 446.30 simplex at the launch site for talk-in.

Anyone planning to help with the launch should plan to arrive by 0715 CDT. For those new to balloon chasing, the only necessary equipment is an HT capable of using 446.30 MHz. APRS in the car is helpful but not necessary.

The latest forecast is for a track direction of 145 degrees and a distance of 63 miles. This puts the landing about 10 miles northwest of Maryville MO. The track forecasts still have some uncertainty to them but the area betweee Clarinda IA and Maryville MO looks most likely for our landing zone. NSTAR will probably chase south on US59 to IA-2, east to Clarinda, and then south on US 71.

E-mail me if you have any questions. Last-minute information may be found at http://groups.yahoo.com/group/KNSP/messages . A comprehensive list of upcoming flights is at http://www.arhab.org .

Hi Earl,

I was wondering if you'd put any glazing, e.g. acrylic film, over the
camera view ports. From lack of water drops in the image, I assume not.
So, yeah, maybe lucky, then?

BTW, roughly where do you launch from? Out here in CO, any body of water
that size would be called The Ocean :=P.

I will be entered in a car show in Muskogee, Ok tomorrow (8am-4pm) . I'll take my HT and Arrow antenna and start listening around 9:30-10am. My up/dn will be 446.300.
I'll be at Grid EM25HS.

73 Harry
KC5TRB

FYI - I would take my 26-El KLM but it's bigger than the car! :)

Hey Guys,

How long does it take on the average for the wx buro to get the evening soundings out so we can make a last minute this evening prediction.

The guys in the group here are having second thoughts. because of the HIGH possibility of a swim. This would be a FIRST for NSS, we have never scrubbed a flight scheduled before, so strange territory for me here.

So say we wee to use near space ventures pridiction page, about what time does anyone think it will have the new data for use from this evenings soundings?

Our BEAR 1 flight camera captured several shots of Denali, the tallest point on the North American continent. Check out http://www.bear.437am.com/

After a grueling day long ATV (4-wheeler) journey, we managed to successfully recover the entire payload and we were amazed at what the payload camera captured.

More pictures and video to follow.

That is incredible! What a flight. Thanks for sharing.

I am really amazed at how vertical the flight profile is. Very cool stuff. Looking at the Google Earth rendition helps visualize just how impressive this is.

That recovery must have been tough. Around here it is relatively flat and there are roads nearly every square mile.

Please do post additional photos and vid.

4278. EOSS Powershot Script

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-17 13:44:17 UTC
From: Pete Lilja
Topic: 4278 Message: 4278

A month or so ago I mentioned using the EOSS Canon Powershot script. That really is cool. At that time I asked about bumping up the resolution setting to Superfine and the author agreed it was a good idea. A buddy of mine was able to add that function to the EOSS script and we flew our first balloon nearly 3 weeks ago. Which brings up another idea for the script writers out there. Our payload was lost for 2.5 weeks due to radio downlink failure (that has yet to be figured out). After 2.5 weeks of laying in a cornfield in northern Illinois it was found by a farmer planting the field. He called and I went and picked it up. Amazingly the radio and camera contents of the Styrofoam box we dry and operable. However, the Canon Powershot's lens was dirty. It occurred to me it would be nice to have another function added to the camera script to turn off the camera after it finished taking pictures. When the batteries go flat on the Canon it does not retract the lens. Not a huge deal, maybe, but having that extra protection would be nice for the occasional lost payload.

Hi Pete,

You might consider glazing your camera view port with acrylic film.
This would not only keep dirt out, but also moisture, and would help
keep a little heat in.

From: Mike Manes
Topic: 4278 Message: 4282

Hi Pete,

Well, the camera lens would be exposed to about the same environment
without the glazing, except possibly for some heat from the camera
electronics. I've used inkjet printer transparency film with the rough
side washed off using 70% isopropyl rubbing alcohol for camera window film,
and the only problem I've encountered is some occasional frosting up
when descending thru a cloud - but it dissipates pretty quickly once it
gets into warmer and less humid air since there's very little thermal
mass to hold the temperature. I've seen other folk's camera lenses get
frosted up as well - think I'd prefer the moisture get on the glazing than
the lens.

I've had some limited success using windshield-grade RainX on exetrnal
glass view steering mirrors which have no heat source either side and have
a lot more thermal mass. Might work on acrylic as well, although I've
not tried it on the film glazing.

It's a cheap experiment. If you don't like it, just rip it off.
BTW, I used old, obsolete printed transparencies for mine that were
headed for the recycle bin anyway. What better a 2nd life, eh?

I have never used any covering over the lens and have had no problem with moisture. Here in Oklahoma the dew point is usually 60-70 and the humidity 60-80 in the spring and early summer. I've had the entire contents of the capsule saturated once opened at recovery, but never any moisture on the lens.

4284. moisture on camera lens

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-19 20:31:56 UTC
From: Mark Conner
Topic: 4284 Message: 4284

We've run our cameras 'naked' with the front element exposed to the outside. In the summer we often see condensation on the camera when it descends into warmer and more humid air after being chilled during the flight.

Placing anything between the camera and the outside provides another opportunity for degradation of the optical path. I haven't had much luck with designing something that would keep the moisture out well enough to be worth degrading the pictures.

If the camera is kept warm enough, condensation won't form on it. You can see from the pictures on our 08-B flight that we had condensation for the lowest few thousand feet on descent. I've thought about placing heater elements on or near the camera, but I don't think it would be worth the battery power and weight required. Many chemical hand warmers also emit moisture which creates problems too. If you can keep the camera's temperature above 15 deg C or so, you should be able to prevent condensation in all but the most humid conditions.

Well, of course in OK, the tropopause temp never goes below freezing :=}.

I've drained liquid water from several payloads that descended thru thick
cloud layers, and had to remove corrosion on PCBs which was the obvious
result of heavy condensation. The window glazing won't fix that, unless
the payload housing is a pressure vessel, since the ambient air will
rush in anywhere it can during descent. But a pack of desiccant near the
vent hole can help a lot!

Some thin glazing should help keep the camera warmer by eliminating forced convective cooling. Cheap and easy to try, and it solves the "dirty lens" problem that started this thread.

From: BASE
Topic: 4299 Message: 4299

Dear Mark,

You are correct. I posted lower resolution video on
the web to save server space and decrease the download
time for users. The still photos are simply frame
grabs from the higher resolution video.

I have found the DXG-506V to be a good camera for
ballooning. With a nominal frame rate of 30 fps, I
have captured the burst sequence frames on both
flights where I had an upward pointing camera. The
continuous video capture has also allowed me to
pinpoint the burst time for student filled air
balloons, and determine the moment of payload string
failures (including the free fall on BASE 16). I
recommend the camera, with the caveat that you may
have to do some post flight card recovery and file
fixing on some videos.

Howard

4303. Bad Gas?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-22 00:46:24 UTC
From: Brek Brixius
Topic: 4303 Message: 4303

We have started thinking about our second flight (if / when) that happens. Anyhow, I thought it might be nice to have some helium around so I stopped at the local supplier and asked for a T tank of helium. They only had one tank of helium and it was kind of a take it or leave it situation so I took it. I think it is only a K tank and that is marked "balloon grade".

I remember a thread a long while back saying that Balloon Grade is not desirable. I emailed the manufacturer to inquire about the purity. They won't certify it but they tell me that the gas I have should be about 97.5% helium and the balance plain old air.

As I think about it, it seems like as long as the gas I put in the balloon will lift the load plus extra lift we are OK. It also seems that in order to get to that load plus amount I am going to be adding more gas than I would if it were actual pure helium. That other gas will expand like the helium does under lower atmospheric pressure. Since the balloon will only take so much pressure before it bursts, the overall result is lower altitude.

Is that correct or, is there some other reason why the Balloon Grade gas is bad gas?

Thanks
Brek - KC0YOE

Topic: 4304 Message: 4308

I place (3) 8.5"x11" magnetic signs on my truck (Driver side, Passenger side, Back) during the recovery. It includes 3 lines of text and my logo. I made my own with Avery magnetic paper and stick-on's. The magnetic paper was too think for my printer so I printed on the Avery full sheet stick-on paper and stuck it on the magnets. Works great, $20.00 for 3 signs.

Top Line reads "Chase Vehicle"
Below that is my logo
Second line reads "Amateur Radio"
Third line reads "High Altitude Photographic Balloon"

I have had good responses from by-passers and Park rangers because they could figure out what I was doing without me telling them.
Avery magnet paper: http://www.avery.com/us/Main?action=product.Details&catalogcode=WEB01&node=10210841&productcode=3270
Avery Stickers: http://www.avery.com/us/Main?action=product.Details&catalogcode=WEB01&node=10210893&productcode=3383

Harry,

I used an inkjet and printed in color. My logo has to be in color ;)

Avery magnet paper: http://www.avery.com/us/Main?action=product.Details&catalogcode=WEB01&node=10210841&productcode=3270Avery White Stickers: http://www.avery.com/us/Main?action=product.Details&catalogcode=WEB01&node=10210893&productcode=3383
Avery Clear Stickers: http://www.avery.com/us/Main?action=product.Details&catalogcode=WEB01&node=10210893&productcode=4383I did not cover my with anything but you could use the clear avery stickers instead of the white. Ten sheets come to a pack so you could print on a clear sticker, stick it the magnet paper which is white, then stick another clear sticker over that.

I tried to print directly on the magnetic paper but my older inkjet could not handle the heavy paper. Depending on your printer you might be able to use just the magnet paper.

Hi Brek,

ANSR's first flight suffered from the same problem. They dumped an entire tank into a 1200 and still didn't get the tare weight off the deck. Flew it anyway, since they had no more gas, and clipped off tail end charlie on a tree top during the launch. Turns out they also had inadvertently got "balloon gas" which was 60% N2 and 40% He, IIRC, or vice-versa.

Balloon gas is great for party balloons, since they stay inflated, if not buoyant, for a long time due the slower perfusion of N2 thru the latex skin. But NG for what we do. You'll need a lot more volume of balloon gas - like 2x - to get the lift you need, so a single T bottle isn't likely to get you off the deck, or a proper ascent rate.

97.5% He is welding grade, and it oughta do fine +/- 2.5 %.

Thanks for the numbers Earl. The reason I asked about the fixative is the inkjet ink is water soluble and if you happen to traverse some water enroute it can make a mess of the print. I use inkjet for all my color payload signs and either cover them with clear Krylon or clear packing tape. For my for mono signs I use a B&W laser printer. I also have an old printer and I'll have to see if it will accept the thicker paper.

Thanks again!

Hi Harry,

I tried clear Krylon on an IJP label, and it just made the ink run.
I think there's a better fixative used by commercial artistes & the ilk.

Hi Mike,

No you did it right, but ya have to do it slowly.

we do it on all our payload labeling.

print it out

trim as needed
spray a THIN dusting, (paper is laying flat)
when dry flip over do back side,

repeat as many times as need letting each coat dry, and applying a
heavier coat each time too.
It eventually gets like a plastic and the paper itself is impregnated
with the clear coat and is semi translucent too.

4320. helium... shards cut away... bouyancy dominated descents

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-22 22:41:15 UTC
From: K. Mark Caviezel
Topic: 4320 Message: 4320

RE Bad Gas?
It always pays off to get a straight answer on what is really in the bottle. I recently heard from a manned gas balloon pilot that the ~98% pure crude helium (his term) which used to be used in manned gas balloons was discontinued because the market was low. Most other uses of helium can not well tolerate the impurities in crude helium.
I also recently heard a report of a bunch of seemingly randomly filled helium K bottles in a 12-pack assembly which yielded appreciably less helium than they were supposed to. This was also for manned gas balloon flight and luckily they had just enough to make a good flight.
I almost always 'gauge' my bottles.

BASE wrote:
> Dear Joe and Mark,
>
> Do you return the balloon remnant with your payloads,
> or do you cut away from the balloon?
Howard: I never fly latex balloons. Sometimes I'll do cut away from a plastic floater. Other times I'll have a very elegant bouyancy dominated descent. Still trying to figure out why the big guys don't use bouyancy dominated descents. And still other times, with black plastic solar balloons, there is no flight termination other than the sun going down, which is pretty reliable. This is not really a buoyancy dominated descent, but it is similar. I am still trying to figure out the descent rate of my last solar balloon, but it was quite a bit slower and projected as it was found about 50 miles south of where I thought it would come down.

best

Hey Mike,

I used to use the photography fixative when doing my own prints. It costs 2-3 times more than Krylon and is the same base. The fixative is thinner than Krylon so the trick is to use thin coats of Krylon. I had the same problem you speak of early on.

Well, our labels are small enough that they fit under a single strip
of clear shipping tape. Fast, simple and works great. Just have to
breathe on the tape to kill the static charge before laying it over the
label - otherwise the label jumps off where it's supposed to be.

I may have held the spray nozzle too close to the work so it was pretty
wet when it hit - work was laying flat, but the first shot made the ink
bleed out laterally into the paper. Mebbe it was HP DeskJet ink? Or the
paper?

Hi mike,

I tried this also, with limited success. even with the edges sealed
like tape to tape, fopr some reason we had the ink run badly,

Don't know why. so if it's a color picturte label we do the spray
sealing thing, now if it's Black & white, we use a copy machine,
firsr, the ink will never run from that since the color is actually
melted plastic.

we still seal the paper with the clear spray anyway to help the paper
hold together if it gets tottally wet

4326. Windsor CO "StratoRanch" status

Yahoo group: GPSL (2002 — 2008)
Date: 2008-05-23 02:13:40 UTC
From: Mike Manes
Topic: 4326 Message: 4326

Hi,

Some of you have inquired about Gene Fatton's place near Windsor CO in light of the tornado that hit that town this afternoon.

Well, Gene & I are are on the phone as we speak chatting about swamp cooler maintenance. Gene did take cover at his workplace at FNL airport, but it didn't even blow over his trash cans. He did go into town and reports that things are pretty torn up at the east end of town. There are more first responders than they know what to do with.

Gene's uWave ISP in Windsor is down due to power outage, but his power is OK now.

Just got a real-time NWS alert update: the tornado watch for E central CO is cancelled - and now we're talking about surplus Al honeycomb.

So the good news is the StratoRanch is in fine shape, as is the Fatton clan.

Earl,

I bought 5 - 8.5" x 11" x .3mm sheets at Office depot fo 15$ yesterday. They are white sheets. I printed my Race Car class letters (4")/numbers (8") using my B&W laser printer. Other than a couple smudges that came off with lighter fluid, they look great! I haven't tried printing on them with my old HP. I measured my Skywarn stickers and they are 1mm thick and have a lot more holding power. A good test of these thin ones will be this weekend. I'll be racing so I'll see if they stay on at 100+ mph. That is a normal balloon chase speed, RIGHT? :)

Flying Low!

The answers to those questions and more are under the "Equipment" button
on the web site. IIRC, the balloon envelope weighs 2000 lb and the
gondola complete with pilot in a space suit is over 1000 lb.

Careful. With 10+ balloons in the air simultaneously and a max of 4 using
>>GPS-disciplined<< slotting on a given 2m freq, some APRS beacons and backup
beacons may have to go to 70cm. EOSS plans to fly a crossband repeater
with continuous downlink on 147.555 MHz and uplink on 445.975, plus a
backup DF beacon on an unused 2m freq.

Freq coordination for GPSL is a major PIA.

Harry,
Just got back from camping in Beavers Bend, OK. So - Did it hold up to 100 mph racing? It held up to 70 mph during my chases.

To: GPSL@yahoogroups.comFrom: hhm_74115@...: Fri, 23 May 2008 13:35:24 -0500Subject: Re: [GPSL] Balloon Recovery Sign

Earl,

I bought 5 - 8.5" x 11" x .3mm sheets at Office depot fo 15$ yesterday. They are white sheets. I printed my Race Car class letters (4")/numbers (8") using my B&W laser printer. Other than a couple smudges that came off with lighter fluid, they look great! I haven't tried printing on them with my old HP. I measured my Skywarn stickers and they are 1mm thick and have a lot more holding power. A good test of these thin ones will be this weekend. I'll be racing so I'll see if they stay on at 100+ mph. That is a normal balloon chase speed, RIGHT? :)

Flying Low!

French Skydiver's Balloon Takes Off Without Him
Tuesday , May 27, 2008

NORTH BATTLEFORD, Saskatchewan —

A French skydiver's hope to set a new free-fall record might have come to an end on Tuesday when his ride to the sky left without him.

The helium balloon Michel Fournier was going to use to soar to the stratosphere detached from the capsule he was going to use to jump from 130,000 feet, about 25 miles high.

It happened after the balloon was inflated on the ground at the airport in North Battleford, Saskatchewan. The balloon drifted away into the sky without the capsule.

Fournier appeared disappointed as left the capsule and walked to the hanger. He was hugged by members of his entourage.

The balloon was reported to have cost at least $200,000 and Fournier was said to have already exhausted his finances. His handlers planned a media briefing for later Tuesday.

Fournier, 64, had planned to make the attempt Monday, but had to postpone his plans because of weather conditions.

Attempts in 2002 and 2003 ended when wind gusts shredded his balloon before it even became airborne.

Fournier hoped to break the record for the fastest and longest free fall, the highest parachute jump and the highest balloon flight. He also hopes to bring back data that will help astronauts and others survive in the highest of altitudes.

An army of technicians, data crunchers, balloon and weather specialists arrived recently in North Battleford, a city of 14,000 near the Saskatchewan-Alberta boundary, for the attempt.

Fournier had planned to make the jump in his native France, but the government denied him permission because it believed the project was too dangerous. He then came to North Battleford, an agricultural and transportation hub northwest of Saskatoon.

Spokeswoman Francine Lecompte-Gittens said Monday's postponement was due to unfavorable weather.

Fournier, a former army paratrooper with more than 8,000 jumps under his belt, planned to be three times higher than a commercial jetliner. A mountain climber would have to ascend the equivalent of four Mount Everests stacked one on top of the other.

It was expected to take Fournier 15 minutes just to come down, screaming through thin air at about 900 mph — 1.7 times the speed of sound — smashing through the sound barrier, shock waves buffeting his body, before finally deploying his chute about 6,000 yards above the prairie wheat fields.

Hey Earl,

Yep, they held on just fine. I put some double-sided scotch tape on the front and rear vertical edge of the one on the drivers side because that was the side on the flagman/starter and I wanted it to stay put. The one on the passenger door was just stuck magnetically and it stayed put. Top speed was 105 mph with a surface wind of 15-25 mph. You can see the pics here... http://www.myspace.com/kc5trb click on "View My: Pics" and then "Dodge '03 SRT-4". You'll probly have to log in to MySpace to view them. The ones I made are the black on white (last 3 pics). While you're there look at the videos. The pics and videos are Hallett 05/24/08.

* Chris (KB0YRZ) you'll appreciate the videos! ;-) *

If I decide to make color ones I'll probly take them to Kinkos and use a color laser printer.

From the CNN video, it looks like the Huch clutch released before the lift line was attached to the parachute (if that's the orange thing Fournier's walking past towards the end of video.

http://www.cnn.com/2008/WORLD/americas/05/27/freefall.skydiver/index.html#cnnSTCVideo

BTW, the videographer gets 10 demerits for staying focused on the talking head when the balloon released.

That figure was just the price of the balloon. Cheap compared to the
4000 m^3 (108,000 cuft) of Helium required for a complete fill. You
run the numbers :={.

Joe...I had something similar happen once with a 54,000 cubic foot zero pressure balloon....we had 150 pounds of nozzle lift and our 100 pound rocket fell off at liftoff onto the boat deck pointing at us and making a hissing sound....some of us considered jumping overboard until we realized it was the nitrous escaping safely.

The only payload attached at that point was my 10 pound ATV transmitter system and the command/control link.....150 pounds of lift with a 10 pound payload...wow, what a wild ride that was.....we were 100 miles out to sea in the Gulf of Mexico...it splashed down next to a tugboat 11 miles away and they immediately recovered it and we got it back....turned out to be from the same company of the tugboat that was towing our barge....small world even miles out to sea.

Although pricey....it was considerably less cost than $200,000.

If it was indeed a premature cutdown (we've had similar problems with both premature and non-functioning cutdowns in the past - these were commercial cutdown devices and were not cheap)....it's fortunate for him that it cut down prior to him lifting off since that could've been deadly unless he was high enough for the parachute to deploy. I remember one test I observed of a new superpressure balloon with Nylon 6 material that prematurely activated the cutdowns due to the static electricity generated by the Nylon balloon envelope.

http://www.canada.com/saskatoonstarphoenix/news/story.html?id=d286718b-065b-4bb4-b631-713f81912f2e&p=1

NORTH BATTLEFORD -- A misfiring fuse about the size of a felt pen thwarted Michel Fournier's third attempt to skydive from space, his team says.

When Fournier's massive helium balloon launched without him early Tuesday, the launch team believes a "freak accident" caused some equipment to strike the ground, triggering a small explosion and separating the balloon from the capsule and its parachutes, spokesperson Francine Gittins told a room packed full of reporters and Fournier's supporters late Tuesday afternoon.

"I'm not about to give up," Gittins translated for Fournier, the 64-year-old French adventurer who wants to freefall from 40 kilometres above Earth.

"Unexpected freak accidents do happen."

Balloon experts working on the project who have 25 to 30 years experience in the field have never seen such a problem, Gittins said.

The former French army colonel insists he will try again, likely in August in North Battleford, he said.

"If you don't believe in what you're doing, you might as well give up," Gittins translated for Fournier.

When he returns, he'll use the same balloon design and he'll bring two, despite costing $500,000 each.

"Why change then, the balloon has been tested today, and it is working great," Gittins translated for Fournier.

After Monday's launch was aborted due to wind, Tuesday's attempt seemed off to a promising start.

Shortly after 2 a.m., Fournier was tucked into his silver capsule on the tarmac at the North Battleford airport and breathing pure oxygen to prevent decompression sickness.

The sky was pristine and the tattered airport flag clung lifelessly to its pole. It was a perfect day for Fournier to freefall faster than the speed of sound and break four world records -- the highest skydive and manned balloon flight, and the longest and fastest human freefall.

At 4:11 a.m., the gush of helium from tanks on a tractor trailer was audible from hundreds of metres away.

Slowly, two tubes fed life into the top of Fournier's translucent white balloon, and 45 minutes later, it sat in a teardrop shape, clamped into a winch at the base.

Just after 5 a.m., one truck honk sounded and a small helium balloon floated into the sky. Moments later, two honks sounded, and the massive balloon was released from the spool pinning it down.

Fournier's supporters let out hurrahs: Launch time was finally here. Their glee lived for just seconds.

There was a pause as the balloon floated skyward and Fournier's capsule didn't move.

"No. It's not possible. It's not possible," a member of Fournier's team said in French.

The assembled crowd of journalists and spectators watched the adventurer's balloon undulate into the sky like a swimming jellyfish.

Half an hour later, the balloon appeared as a bright white golf tee against the blue sky; then it was a speck; then it was gone.

The Russian-made apparatus broke into pieces as it fell from the sky.

At 7:12 a.m., information was posted to Fournier's website saying his team had retrieved the balloon's shredded remains about 40 kilometres south of the Battlefords.

Ironically, it was likely just as supporters let out the jubilant cry that the fuse blew and grounded Fournier's third attempt at the stunt.

On Tuesday afternoon, French science journalist Michel Chevaler pointed to diagrams and explained how a group of mechanical parts join together to form the "flight chain." This mechanism attaches the bottom of the helium balloon to the tops of three parachutes, which are fastened to the capsule carrying Fournier.

The parts slot together but are held by a cable. Underneath the cable lie five explosive bolts that can cut that tie when detonated, Chevaler explained in French. All five are triggered in different ways, and the many options are a safety precaution, he said. The bolt that blew was one controlled by radio from the ground.

Had Fournier ballooned to the edge of the stratosphere, he would have pushed a button on a timer to set off one of those bolts, which would have separated the balloon from the capsule long after he had dived away.

Fournier became aggravated when asked what he says to suggestions he could have pushed the button himself to purposefully abort the launch.

It was like having a "hammer over his head" when he climbed out of the capsule after another failed attempt, Gittins translated for him. At several points in the media briefing, Fournier became flushed, squeezed his eyes and gulped to stop tears falling from his moist eyes.

Fournier's previous attempts at the super jump were in North Battleford in 2002 and 2003.

4355. W5GB-9 appears to be on a large balloon somewhere over NM or AZ

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-01 10:16:01 UTC
From: wb8elk@aol.com
Topic: 4355 Message: 4355

While looking at the APRS propagation page to see if any band openings (a massively large tropo event covering the entire state of Texas was evident), I noticed the telltale sign of a high altitude balloon over Arizona/New Mexico that was being copied as far away as Blythe, CA.....it appears to be an APRS transmitter onboard a large scientific balloon launched from Holloman in NM and shows up as W5GB-9 (the NMSU, Las Cruces Radio Club)....it appears to have been up since 1400z yesterday...the last transmission I see was at 0908z. Their GPS appears to have failed early on in the flight as the altitude hasn't reported above 12000m and it is now showing a position over Brazil moving at 586 mph....but the digipeaters receiving it show it near Arizona.

I can find no other info on the flight and can't find the NMSU radio club's website....if anyone has any more details on this flight, it'd be greatly appreciated.

They may have cut the balloon down since I haven't seen anything since 0908z.

73s de Bill WB8ELK

Ok Greg, thanks. I use QRZ 99.99999% of the time and so forgot Buckmasters db was out there and available. Should of just Googled ham call and it would probably ... yep second hit in google not counting a QRZ related second hit page.

Thanks for the corroboration.

http://www.youtube.com/watch?v=tzJVp4ux4Bo&eurl=http://www.avweb.com/eletter/archives/avflash/1134-full.html

I'd be curious to know what type of material they use for the pylons, as the small airplane completely shredded it when it made a direct hit. (About 1/2 way through the clip.) This might be great material for ARHAB payloads.

best regards,

- Mark Caviezel

Hi Mark,

Looks like it's made out of something like nylon (or perhaps a paper material) and is inflated with air as they deflate and collapse immediately after the pilot hits one of the pylons.

Yes ... they use a gondola, filled only with pounds and pounds of fine
steel shot as ballast. Thus at launch they stress the balloon to their
limits. Is the standard procedure with a new balloon before hang beneath
it a payload worth a pair million bucks.

No one wants also a catastrophic failure as ocurred in the past. Aside
the security is much imrpoved too, the agency is very afraid of damaging
third party in any sense. After each flight the balloon carcass is
disposed in a secure place. As far as I know even they dont want a
collapsed gas bag travelling in the wind at ground level provoking a car
accident having a NASA sign on it nor killing a cow that eated plastic :-)

Back in the old days...on June 6, 1989, a NASA stratospheric balloon
launched from Columbia Scientific Balloon Facility (then known as
National Scientific Balloon Facility) in Palestine, Texas, suffered an
uncommanded payload release while flying at 120,000 feet over a
thunderstorm near Graham, Texas. Months after the accident, a
post-flight investigation concluded that a lightning bolt traveling up
from the clouds provoked the incident. The payload hit the ground at an
estimated speed of 700 mph (1,100 kph). No one was harmed, but the
incident forced the agency to change its policy, forbidding the flying
of balloons over thunderstorms. More details in
http://stratocat.com.ar/fichas-e/1989/PAL-19890609.htm

Hi!

This is the official NASA info on regard the flight.

This was a flight qualification test of the new A34.43-3 balloon
design with a fully loaded payload, 8,000 pound suspended weight.
Part of the payload was a piggyback instrument, BalloonSat, being
flown for NMSU. The BalloonSat instrument is a set of
photomultiplier detectors to measure the earth's background
radiation at 450-nm. It will characterize that background for
further cosmic ray studies. The BalloonSat configuration will also
provide a test of the engineering concepts for a university
nanosatellite payload in a near-space environment. BalloonSat was
developed by NMSU under a US Air Force program.

By the way...¿can I post the pictures on my website too..? I'm
planning tonight to update the news page with the balloon flight.

Yup. A gutsy flight, particularly in light of the fact that the dood that tried it earlier ended up in an uncontrollable spin and bought the farm. This work was part of pre-NASA efforts to put a man in space, and was investigating various means of getting him back home.

Joe's record for a record free-fall altitude and speed still stands today, and it's the one that French parachutist, M. Fournier, hoped to break last week; alas, the cutdown device fired during the launch sequence from Alberta CN, leaving him and his gondola on the deck.

Now, the tail end of that video is baloney. Joe landed in in the NM desert, sans surfboard.

BTW, I met Joe a few years ago at a manned gas balloon event. Real nice gent, and a ham, to boot. His call is N4HDP (Hot Dog Pilot), and he was running a theme restaurant, Rosie O'Grady's, in Kissimmee FL at the time.

I think you are referring to a previous jump by Kittinger where he went into an uncontrolled spin with the parachute shroud line wrapped around his neck...he almost lost consciousness but did survive that descent (I believe that one was from about 70,000 feet or so) to later make the big jump shown in the video.

From: Mike Manes
Topic: 4372 Message: 4372

Bonjour, monsieurs,

Please forgive my use of English - my French was just barely adequate to give me an understanding of how your fast release device operates, as shown on your web page:

http://raqi.ca/braq/modules/separateur/separateur.htm

Very clever! And apparently much lighter and easier to build than the one that I developed for EOSS:

http://www.eoss.org/hardware/quick_release/index.htm

I do have some questions, if you don't mind:

I have never seen the off-the-shelf brass pieces that you are using, and I'm not sure where I might find a "quincaillerie" here in Baja Canada. Could you elucidate a little?

I found it necessary to use an anaeroid cell to keep the EOSS release device locked through the launch sequence and in upper air turbulence below 70k'. Have you found that necessary for your device?

Mike and I traded a few offlist emails on this puzzle already.

The quinc (thank's to Google) turns out to be a hardware store.

I just took a better look at those parts, and now I'm thinking
the grooved ends might be barbs for fitting into some kind of
flexible tubing.

Whether it would be for water and plumbing, or for air, I
wouldn't hazard a guess.

Yeah, I saw that as well. But I seem to recall from "The Pre-Astronauts" that

there was one fatal accident during the Man High program before Joe's jump.

73 de Mike W5VSI

>>>>>>> from Mark >>>>>>>>>>> As far as I know, there were no fatalities in the Man High program. Maybe you're recalling Victor Prather, a US Navy officer who died of drowning after landing the Strato-Lab gondola on the Gulf of Mexico. That mission featured no skydiving or free-fall. The accident was in 1961, the year after Kittinger's highest Excelsior jump.

best regards,

- Mark Caviezel

Bonjour Michel,

Et merci beaucoup pour votre info!

Again - I shall not agonize you further avec mon Francias tres mal!

There were a number of other balloonatics on the GPSL reflector who were wondering about those brass pieces. You have defined them quite well!

I hope you don't mind my copying GPSL on this email.

It's interesting that you keep your parachute packed in a bag during ascent. Most of the others attach the balloon to the top (apex) of the parachute and the payload line to the bottom of the shroud lines, using a "spreader ring" to hold the shroud lines apart to ensure rapid inflation on descent.

I take it then that the separation device remains closed by simple friction until tension is applied to the line? Or must the release wire be actively moved to open the device? I could not tell from the video how that part worked.

The EOSS fast release is held closed whenever line tension exceeds about 1.4 kg (3 lb) and is opened by a spring set for that tension. A locking arm is engaged to keep the device closed before launch, and that arm is moved out of the way by an anaeroid cell on ascent above 70,000 ft. We did this because we have observed some pretty strong turbulence when passing directly through the jet stream. That is fairly rare, however.

One advantage, and the primary purpose of the EOSS device, is to separate the balloon line immediately upon burst to prevent any fouling of the parachute or payload string by latex shards. It does that very well. Previously, we waited to get an indication of burst and then sent the DTMF command to burn the line, but too often, that was too late to prevent fouling.

We did include a commandable release feature in the event of a "floater" or to avoid landing in an undesirable area. That did add considerably to the complexity, however. We've not yet used it, however.

Another advantage is that there is no need to rebuild the line burner each flight or to replace its batteries. Flight preparation is just a matter of tying on a new balloon line to a ring and clipping the ring into the jaws. Voila'! Fait complet!

Congratulations on your successful flights! I look forward to seeing the pictures and videos.

Gene,

How about asking if they would like to be sponsors of GPSL 2008? They could send enough copies (25-30) for everyone to have one, and I would be happy to list them as a sponsor on our web page (superlaunch.org). Or you could just work out some other arrangement good with them.

On Feb 16, 2008, at 10:41 PM, Gene Harlan wrote:

For those of you that have seen VHF Communications before, you know that it is a great technical publication. It is a quarterly publication covering VHF, UHF, and microwaves. There are many construction articles primarily for the higher frequencies. I learn something every time I read an issue.

Harlan Technologies is the USA distributor, and we will be happy to take your subscriptions. Subscriptions are $44.00 per year (2008 rate).

If you are not familiar with the publications, the publisher Andy Barter has sent a few sample issues to try and get the USA subscription interest up. If you think that you might be interested in subscribing but just not sure, send me your mailing address and I will be happy to send a sample to help you decide if you would like to subscribe.

When they are gone, that's it. First come, first to get the samples.

28.215 LSB

AA4UT RTTY beacon, being tested for flight this Saturday at Knoxville, TN hamfest.

Please listen for it and if you copy send me a report.

Sample telemetry:
RYRYRY AA4UT/B
GPGGA,232714.000,3558.7504,N,08401.2469,W,1,09,1.2,345.7,M,-32.1,M,,0
BATT 09.34 VOLTS TEMP P28C 7/9$7!")s8
75-0

You can download a RTTY listening program at:
http://dtrc.utarc.org - download and use DTRC It will send your telemetry readings to Univ of Tenn's server and display for anyone wishing to confirm reception.

http://dtrc.utarc.org/dtrcpeek.php?call=K4HSM - my telemetry relay

http://dtrc.utarc.org/dtrcpeek.php - Takes you to list of ppl on DTRC sending info.

Thanks for any help you can provide. I don't hear much on 10m atm so I don't think we'll get many reports as this is less than 1 watt, but as gray-line hits you might get lucky.

We'll keep the beacon running a couple of hours or so.

Thanks
Greg Williams

4383. UTARC UX-24 balloon launch scheduled for the Knoxville Hamfest

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-11 03:14:55 UTC
From: Greg Williams
Topic: 4383 Message: 4383

UTARC will be participating in the Knoxville Hamfest for the third straight year with a balloon launch Saturday, June 14.

The flight will be a simple demonstration of RTTY on 10 meters. It will not be compliant with the DTRC tracking through the Spirit of Knoxville web site, however DTRC can be used to relay the telemetry back to UTARC's servers for data validation.

Plans are to launch NET 10:30 Eastern time, compliant with hamfest forums and presentations not conflicting at that time.

A latex balloon will be used to send the payload up to altitude, then burst and plummet back to earth.

Frequency will be 28.215MHz LSB

Recovery is optional. There will NOT be 2m APRS this flight.

As always, things may change as the next 72 hours progress, so stay tuned.

You can download a RTTY listening program at:
http://dtrc.utarc.org <http://dtrc.utarc.org> - download and use DTRC It will send your telemetry readings to Univ of Tenn's server and display for anyone wishing to confirm reception.

http://dtrc.utarc.org/dtrcpeek.php <http://dtrc.utarc.org/dtrcpeek.php> - Takes you to list of ppl on DTRC sending info.

Joe,

I don't know anything about this particular product,
but I can tell you that it's nothing special, specwise or
pricewise.

One I saw a while back on ebay, and it's there tonight,
specs 6-12 mA with 12 being a max, and the same low voltage
operating ability. It would work on my handheld which
sources the ext. antenna with about 3 volts.

This kind of performance (low voltage and current) is
commonplace now for putting an external antenna on a
handheld.

Hank

FWIW, it's actually 6-11 mA.

I haven't bought one, but was thinking about it to get
better performance in thick woods. The GPS is a fairly
old, but good Garmin "EMap."

4392. BASE 24 - 18 June 1300 UTC

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-17 17:42:11 UTC
From: BASE
Topic: 4392 Message: 4392

BASE 24 is go for flight tomorrow morning. Launch has been move to Crawfordsville High School (Crawfordsville, Indiana) with an anticipated landing southeast of Columbus, Indiana.

Two radios broadcasting APRS information will use 144.39 MHz (call signs W9YJ-11 and W9YJ-12). Live data downlink on 900 MHz spread spectrum radio.

Experiments to be flown:

Relative Photometric Measurements of Absorption Lines of Carbon Dioxide, Water Vapor, and Ozone

Polarization of Skylight - powered by a solar cell

Compact Dual Axis Coincidence Geiger Counters

Three video cameras - two DXG 506V and one Aiptek

Details will be posted on the website:

www.depauw.edu/acad/physics/base

4394. WB8ELK balloon to fly simplex repeater for Field Day from Huntsville AL

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-24 22:03:09 UTC
From: wb8elk@aol.com
Topic: 4394 Message: 4394

I've finalized the payload frequency...I'll be flying a simplex FM voice repeater on 144.36 MHz....I'll be attempting to link into the Ft. Wayne IN balloon (KB9ZNZ-11) that will be flying a crossband repeater with 144.36 input and 446.025 MHz output at the same time.

I'll also be flying the new HF transmitter board with onboard GPS on 28.175 MHz in the following formats: RTTY, Hellscreiber and DominoEX5 at the top of each EVEN minute. I'm hoping to work some E-Skip with this on 10m since the band has been wide open on Es just about every day.

Location: Huntsville AL - NSSTC building
Launch Time: between 1:00 pm to 2:00 pm CDT on June 28th

Simplex repeater - 144.36 MHz (20 seconds record/playback)
HF transmitter - 28.175 MHz (RTTY, Hellscreiber, DominoEX5)

Potentially long duration latex flight.

- Bill WB8ELK

Subject: [GPSL] Garmin 18 LVC Magent

For the life of me I remember someone removing the magnet from this hockey puck receiver,

but i can't seem to find it now.

who did it?

how did they do it?

did it effect it's operation?

Joe

Us also, hope they appear soon as well as any after effects on
performance.

of course the water resistant properties is Nil, but not a concern.

4398. Solar balloon internal tracker

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-26 00:05:31 UTC
From: K. Mark Caviezel
Topic: 4398 Message: 4398

Brek:
Sounds like a good plan.
I put up a solar balloon in conjunction with the 2nd Annual International Solar Balloon Day (nominally June 21, but I had to delay a day..... clouds!)
Here is a video of the very slow departure:

http://www.youtube.com/watch?v=XQfRX3pFnV0

Payload weight on launch was 5.5 lbs, decreased to 2.5 lbs with sand jettison. Most of the flight was between 50k and 54k feet.

best regards,

- mark ng0x

Nah,
We just have weak lakes that can't hold their water. what a mess!
Luckily I'm about 800 feet above in elevation to the nearest lake or river.

BUT

the other day was one of those days where the most common saying was,

"You want to go where?" Hmmmm, "You can't get there from here"

The Rail industry is trashed. Over 300 miles of track just gone.
thousands in questionable service.

Anyway it was cool to se them using the WWII Ducks to rescue people.
that was way cool!

Have you seen that message yet about stripping down that GPS? I
haven't yet.

Yeah, I did see Hank Riley's reply to the reflector. IIRC, the case and magnet was stripped off to reveal the patch ant and receiver underneath it. Seems to have worked OK.

Keep yer feet dry!

Yeah i just bit the bullett and ripped it apart. fo the most part it's easy. and by the layout i know it will function exactly the same.

The hardest part os that molded rubber part right where it comes out of the puck!

LOTS of micro surgery with a scalpel to get that baby apart.

4405. WB8ELK Field Day balloon HF frequency change

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-27 22:23:54 UTC
From: wb8elk@aol.com
Topic: 4405 Message: 4405

While testing my 10m transmitter, I heard the VE3TEN propagation come through loud and clear right on the transmit frequency I had announced earlier...therefore, I'm moving it down 3 kHz to 28.172 MHz (on USB, it's best heard at 28.171 MHz).

Format: starting at top of each EVEN minute: RTTY, Hellscreiber and DominoEX5.

The simplex voice repeater will still be on 144.36 MHz...20 seconds record and playback.

Not certain if I'll put an APRS beacon on it, but if I do it will be WB8ELK-11 on 144.39....probably only every 1 or 2 minutes so as not to interfere with the simplex repeater too much.

Launch time: around 2:00 pm CDT Saturday June 28th
Huntsville AL - NSSTC building near UAH campus

- Bill WB8ELK

4407. WB8ELK Field Day balloon flight recap

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-29 08:31:27 UTC
From: wb8elk@aol.com
Topic: 4407 Message: 4407

Although fairly high surface winds, we managed a takeoff at 3:57 pm CDT...we decided to wait until the Blue Angels had finished their performance at the airshow since the prediction showed a possibility of flying near the Huntsville Airport if it got high enough into the strong easterly stratospheric winds.

We didn't fly the HF telemetry transmitter on 10m and instead put two APRS trackers onboard in addition to the simplex voice repeater.....WB8ELK-11 using a Garmin GPS18-LVC with Microtrak 300 and N4XWC-11 using the Deluo GPS receiver/Microtrak300 to see where it would die out.....the simplex repeater worked great throughout the flight (Alinco DJ-S11T with modified half wave dipole and the new Argent Data simplex repeater module)....the audio quality was superb with this new module.

We had simplex repeater contacts with Field Day sites in Georgia, Tennessee, Kentucky (W4HTB at KY4BG FD site) and a couple of contacts as far away as Mt. Vernon, Illinois where I worked Bob KA9UVY at 300 miles and Shannon KC9BIE in her mobile.

We made it to 115,078 feet and sure enough on it's descent it went directly across the Huntsville Airport but fortunately high above it....the payload landed just 400 feet inside the west gate of the Redstone Arsenal and is still transmitting it's position as I type this (12 hours after the launch)....the simplex repeater is still operating as well. Monday I'll see if I can get the base MP's interested in some balloon recovery exercises.

Landing location: 34d 38.79m 86d 42.94m

We had watched the ozonesonde launched at 1:00 pm CDT come right back to us after flying 16 miles east and we watched the burst directly over the building....we estimated a landing near Monte Sano mountain. Since we were frustrated over not being to recover the simplex repeater payload from the Arsenal, Shane N4XWC, Dick W1TV and I decided to try to find the ozonesonde.....after wandering the mountain until sunset, we gave up and returned to the Huntsville Field Day site and about 2 miles away, we heard the ozonesonde loud and clear on 403 MHz...we DF'ed it to the top of the roof of the Inergi building on Governor's Drive in downtown Huntsville....no payloads recovered, but at least we know where they are.

- Bill WB8ELK

PS.....the Byonics Deluo GPS receiver flown on N4XWC-11 died out at 78,856 feet, which is a lot higher than I expected it would shut down...it never did track again after locking up but the transmitter kept sending out the last know position.

Dear Friends,

BASE 25 - a 1200 gram balloon with 900 MHz spread spectrum live data downlink and APRS signal every two minutes at 144.39MHz - using call sign W9YJ-11 will carry the photometric atmospheric composition monitor and polarization measurement experiments. The launch is scheduled for 1500 UTC on 30 June from Northmont Schools in Crawfordsville, IN. We may launch up to an hour earlier if ready and necessary. Additional details at: www.depauw.edu/acad/physics/base

From: dlkaiser23
Topic: 4409 Message: 4409

We found a supply for helium and are taking orders for helium and hydrogen for GPSL.

The cost of helium will be $132/bottle, including delivery charges.

The cost for hydrogen will be $56/bottle, including delivery charges.

Keith will be adding a Paypal button to the Superlaunch.org site that you can pay through, but for now i just need a final count for gas so we know what to order in total.

We need you to pre-pay for your gas, either through PayPal or send a check to Keith Kaiser at
6024 N Ames, Kansas City, MO 64151 if you prefer. We will accept orders until July 9, 2008.

Please let me know if you have any questions or concerns.

Deb Kaiser

4410. Final Lunch Orders

Lunch on Friday at William Jewell College will be "create your own sandwich and soup bar" catered for $10/person. I need a final count of the number of people in your group who will want to order lunch.

Keith will be adding a Paypal button to the Superlaunch.org site that you can pay through, but for now i need a list of names of those who want to eat at the college so i can give them
a final estimate for the number to expect.

We need you to pre-pay for your lunches, either through PayPal or send a check to Keith Kaiser at 6024 N Ames, Kansas City, MO 64151 if you prefer. We will accept orders until July 9, 2008.

Please let me know if you have any questions or concerns.

Thank you.

4411. GPSL Frequency & Time Slots

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-30 05:02:39 UTC
From: Nicholas Stich
Topic: 4411 Message: 4411

I know that frequency coordination is going to be handled by somebody in our group (NSV) but I thought I would start the discussion.

I would like to get my packages setup and tested, thus I would like to settle on a frequency and time slot.

I would like to use two 2M APRS systems and a 70cm unit. I would like to suggest a 6 second slot, which would allow up to 10 balloons/packages to be on one frequency.

I would 144.99 with slot 13-18 & 18-24. I am open to suggestions on the 70cm band ?

The Balloon will be flown as N Stich - K0NMS. I also plan on flying my balloon on hydrogen.

Suggestion & Comments Welcome.

Best Regards,
Nick

BASE 25 was successfully completed today. Launch at 14:55 UTC. Surface winds were between 20 and 30 miles per hour. Average ascent rate of 1100 feet/min. Maximum altitude of 97,800 feet. Landing at 17:09 UTC. Recovered by the resident filling his outdoor swimming pool. Landing site was in a raspberry patch (berries not yet ripe). Great circle distance of 32 miles at a heading of 184 degrees from the Northmont School launch site.

Data analysis has begun and additional information should be on the website (www.depauw.edu/acad/physics/base) within the next 24 hours.

That's what I hoped would not be the case, but suspected otherwise by something I read on the internet. Not sure, but I think a group of gases, all of them inert, share the same fittings as helium. For example, argon is one of them.

Users new to hydrogen should keep this fact in mind that helium fittings will not go.

Hank;

And in searching for a Hydrogen regulator it appears that it shares left-hand thread with a number of flammable gases.. Depending on flow rates and input, output pressures, the costs for a new one ranged from $150 to $500 of so.

I used google> hydrogen gas regulator

that could be the common factor?

inert and non flammable right had thread,

flammable lefty just to make a double blind redundant fool proof safety factor so someone can not even by accident hook up to the wrong type of tank.

that very well could be

Dear friends,

The left handed threads are not just for flammable, but includes other nasty things (e.g., highly corrosive like the halogen gases (fluorine, chlorine, etc.)). It is a final safety barrier. Of course, one could still get in trouble by changing the input nipple on the regulator.

4425. Helium and Hydrogen fittings

Yahoo group: GPSL (2002 — 2008)
Date: 2008-06-30 20:54:16 UTC
From: K. Mark Caviezel
Topic: 4425 Message: 4425

Ouch, helium prices are sky high!

Helium (and Argon, and Nitrogen) bottles have a CGA 380 inert gas fitting.

Hydrogen (and Ethylene, and Ethane, and Methane) bottles have a CGA 350 flammable gas fitting. You'll need a CGA 350 nut and nipple to convert a helium regulator to hydrogen, for those of you using regulators.

I strongly recommend use of a six point box end 11/16" wrench to remove the nipple from the regulator. I also recommend a 1 1/8" wrench (not an adjustable one) for installing the nipple nut onto the bottle.

Hi Mark,

Now this part is really funny. And I have yet to understand it either.
the regulator we have is stone age, It's got to be close to 50.
Yet no tools needed, we have ever since we forgot the large wrench as
you state below, we just hooked it up and went finger tight expeting it
to leakl sooo badly, funny, nothing.
The only time we ever had a leak at the bottle connection was that one
time where it had this huge ding in the fitting, and then a latex glove
fixed that,

funny huh?

2 lunches for Ron & Tim Cathcart, already paid thru paypal link.
Looking forward to meeting you all during GPSL 2008...

While I am posting here I have a basic question. What are people using for the balloon load line. Far 101 says 50lb test and I will be using a flight termination unit IE hot wire cutter. Kite sting is easy to find in 50 lb test rating, and it is polyester braid material. Before I order a bunch of this stuff I wanted to confirm it would melt when using the hot wire cut down method. Open to suggestions if others are using something different.

Thanks

Ron Cathcart

Hi Nick,

EOSS will have 147.555 and 445.975 in use for its crossband repeater, and it's rockbound there. We plan on using 144.340 for APRS, and we can slot. But we may also have a digi running there (alias EOSS) as well as approximately slotted telemetry, so 6-sec slots may be a bit tight. We'll also have a DF beacon/cmd on 145.600 running 30/30 on/off and ATV on 426.5 MHz DSB AM.

Suggest 144.36 and 144.39 slotted at 15 sec, with 144.39 used for non-slotted beacons (some digi is likely to hear most beacons, even if some collide). Might check if 144.99 is in use for a cluster or BBS in the KC area.

Some of my payload frequencies planned for GPSL:

WB8ELK balloon:

- APRS #1: WB8ELK-11 (fixed on 144.39)
- APRS #2: WB8ELK-12 (can go any frequency with this one)

- ATV: 439.25 MHz

- HF: 28.173 MHz (RTTY, Hellscreiber, DominoEX5)

Perhaps our He regulator can be fitted with a hydrogen (left-hand thread) tank fitting?

Any special characteristics for a hydrogen 2-stage regulator vs. one for He?

The NWS guidance dox say to use a regulator between the tank and the fill hose, but we abandoned our He regulator some time ago, since it tended to freeze up in humid environs, and have have been controlling the fill flow thru a 1/2 rubber air hose just using the tank valve.

So, is a regulator really necessary? Is it there to prevent that oft-reported ignition when cracking the tank valve? I'm told that ignition produces just a benign "pop" when flow is into to a constrained system, since it consumes just the little O2 present near the the tank outlet and doesn't propagate farther.

Hi Ron,

FAR 101 states "an IMPACT FORCE of 50 pounds" [emphasis supplied] ... don't make the common mistake of confusing that with tensile strength, which is measured using a gradually applied stress. Quite a few balloonists who have made that error and used 50# fishing line have observed their balloons soar skyward at an astounding rate, unburdened by the payload string left behind at the launch site.

I have never found a definition, ad hoc or otherwise, for "impact strength", but it's implicit that the intent here is to ensure that the payload line will break if it's hit by an aircraft. Some back-of-envelope calculations show that such a collision at 150 MPH would accelerate a 6 lb payload to over 20 G's using woven nylon line. So stick with 240 lb woven nylon, and grant that even the best knot will cut the tensile strength in half.

Scuba shops carry a variety of woven (eschew twisted!) natural nylon line - with warrants that no nylons were harmed in their production :=}.

Oh, and use double-loop bowlines - easy on the line and easy to untie after being pulled tight.

BASE (DePauw):

Primary tracking: 900 MHz spread spectrum. We've flown with Taylor before with no cross-talk problems.

Secondary tracking - frequency fixed 144.39 MHz using W9YJ-11

Pod-to-Pod on 2.4 Ghz (shouldn't cause any problems)

4444. EOSS GPSL Freq Request

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-02 03:21:30 UTC
From: Nick Hanks
Topic: 4444 Message: 4444

Brian,

EOSS requests the following frequencies for use during the 2008 GPSL flight.

1) Primary tracking freq requested: 144.34 MHZ
a) Do you have freq agile equip? Yes (Can change to freq that GPSL ground I-gates will be using or 144.39 MHz to use Kansas City APRS digipeaters)

b) Call sign & SSID: AEØSS-11

2) Alt tracking freq requested: 147.555 MHz Down, 445.975 MHz Up
(Crossband repeater and APRS Beacon in one package). Don□t expect this freq to be I-gated

a) Do you have freq agile equip? No

b) Call sign & SSID: W0WYX

3) Other mode freq requested: 426.25 MHz Down
a) Mode: ATV

b) Do you have freq agile equip? No

c) Call sign: W5VSI

4) Other mode freq requested 2: CW Beacon 145.600 MHz
a) Mode: CW (Sends □DE AE0SS□and then tone) once every minute for 30 sec.

b) Do you have freq agile equip? Yes

c) Call sign: AE0SS

Thanks for coordinating frequency use for GPSL. Very helpful.

73,

Nick

NØLP

Might also get input on APRS time slotting capabilities. Some beacons will initialize GPS time only on the first valid RMC or GGA, and then use RC or piezo clock afterwards, so they can drift quite a few seconds over a couple of hours, especially at temperature extremes. Other beacons use much more stable clocks, while others update slot timing every RMC or GGA frame.

Best to allow some slop between slot assignments to accommodate this drift.

4446. First Totex failure Ever?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-02 17:53:08 UTC
From: Joe
Topic: 4446 Message: 4446

Hi All,

Witht he conversation of all the lists on long duration ballooning. And how the latex ones are supposedbly to rot pretty fast . so when we made our last order for some smaller balloons for more versatile flight profiles on odd windy days, we added 300 and 600 gram balloons to the supply.

but i threw into the mix a tiny 100 gram balloon.

Ive read from a totex web site how they are made, where the thick neck portion isn't made at the same time as the rest of the balloon but they are joined together while making the balloon itself.
it is a cute balloon, Barely inflated diameter of 13"

burst of 77"

so I decided to make a test. I made a 5/8ths wave vertical for 80 meters. 150 to 160 feet tall, and inflated the balloon to about 36'"diameter.
And launched it yesterday at 3 Pm local time.

It was a blast to use! for one.

killer sigs on 80, like everything was 20+ and more, sadlt lightnigng was also, well s 9 non stop,, but was a blast. anyway that is not pertenent to this story.

I finally went to bed a bout midnight,, having,, just too much fun playing with it.

When i got up this morning and went out to look at it, hmm no balloon! did it pop?

Follow the antenna laying across the ground anf find the what is left of balloon.

It did not POP. but the neck portion cleanly seperated from the balloon portion, as if they had a poor connection.

a perfect and clean end, I stuffed a image in the photos section, as seen here.

http://ph.groups.yahoo.com/group/GPSL/photos/view/cdd9?b=2&m=f&o=0

After 20 years, and all those flights, this is the first time a seperation like this has happened to us.

I'm going to see if I can locate the envelope.

it should have defaleted fairly quickly, and there was no or very little wind yesterday so hopeing it shouldn't have gone far.

Joe

Hi Joe,

EOSS experienced a premature burst of a Totex 3000 gm a few years ago. It was carrying about 22 lb - lighter than typical - and it flat out burst at about 65K'. We've seen Totex 3000's carrying 25 lb make over 100K', and every other one has made over 85K'. We've experienced one "leaker" that lost lift gradually and floated at 45K' until we commanded a cutdown.

So yeah, nobody makes perfect latex, but Totex has been very, very good to us over the years.

The photo is a tad overexposed, so can't tell for sure, but it looks like the reinforced neck extends just halfway up the shard - the rest looks like envelope material, although I agree that the separated end sure looks clean. So maybe it did burst after hitting the deck after cooling overnight and/or catching a gust of wind? That happened to us one FD years ago.

No way this hit the deck,

The wire was aluminum fence wire. it was incredibly lightweight, even
if the balloon lost 505 of it's lift it still would have had 200% lift.

so that's not an option.

Winds were nothing all evening and called for dead calm all night, and
when woke up this am it still was dead calm. soo a gust shouldn't be
it either

DON'T GET ME WRONG!! Paul and the Totex balloons are the best out
there. i used many a Kaysam, and they honestly deserved to go out of
business!

OK, then, you mighta got a lemon after all. Might be worth another shot?
Coulda been some dood with a 22?

That FD vertical we did was a 5/8 wave at 160m made from #24 AWG hookup
wire. We needed two balloons to keep it up - one at the midpoint of
the wire - don't recall the size, tho. And, man, it was a real humdinger
while it lasted! BTW, it's NEVER calm along the foothills where we were
sited.

Not that that was a big deal, being it cost a whopping 7 bucks i think
7 or 9 he he he,

Oh i plan on doing it again, why two balloons/ what size and what did
it weigh/

The aliminum fence wire is fantastic,

don't remember the gauge off the top of my head, but one year we made a
full wave loop for 80 for a field day, fed with more of the same line
made into 450 ohm line. put it up as a diamond fashon. base of
diamond was at 100 feet. that was a fun antenna too,

all BIG signals, and every contact was a one caller!

NearSys will need help tracking. I won't have my tracking gear set up in time.

Pau

>>> "Mark Conner" <mconner1@...> 07/03/08 12:28 PM >>>
Hi all,

Due to a variety of circumstances, NSTAR will not be participating in the 2008 GPSL. We hope to be at the 2009 event, though, and we'll certainly miss seeing all the participants this year.

If it works out Wayne KE6DZD and I may come to KC on the morning of the launch to help other teams launch and chase, but that's pretty iffy right now.

Hi Bruce,

The primary cause of flight string oscillation during ascent is wind shear, i.e., variations in horizontal wind velocity vs. altitude. This is Ma Nature's work, so there's nothing you can do to eliminate the cause. But, in that light, you could try two things that might mitigate the effects:

1. Shorten the flight string to minimize the shear differences between the top and bottom of the string, or

2. Rebuild your payload package to make it long (vertically) and skinny and round so as to minimize the lateral drag area and coefficient. This approach will also help immensely in stabilizing the descending payload string, since the it will let the payload housing serve as kind of a plumb bob.

Going to multiple packages will make things worse in that regard, although it's a great way to manage EMC issues such as desense of GPS receivers by beacon xmtrs, etc.

I know of no way to absolutely eliminate the "Sammy Kay" effect, other than to get up into the stratosphere where wind shear is minimal. Unless someone else knows a solution, you'll have to live with it.

Hi Bruce,

That was one weird motion.

We here at NSS has never had one rotate in a matter of a cone's motion
like that. Strange.

I'd suspect the long arms
and as long as you can get train would slow it down.

Bjut maybe not because i would not call that a pendulum motion. that
is moving in one direction only. something we have never had happen on
any of our flights.

4457. Re: [Ballooning] Stabilizing the payload

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-05 03:31:46 UTC
From: Mike Manes
Topic: 4455 Message: 4457

Hi Bruce,

What I wanted to convey is that the "pendulum effect" aka "Sammy Kay Effect" ("Swing and sway with Sammy Kay!" for you post-boomers) is mainly caused by wind shear. Joe Mayenshein's long arms primarily slow spinning by adding rotational intertia to the package - but won't help penduluming much.

Mike

Mike,,

What do you think caused that cone spiral effect they had?

We never had a flight do that, of course we has spin anlong the payload
axis, and a side to side swing like the pendulum of a clock. but we
never had a continous conic shape spin,

except on the trip down we would have a spin like that is the chute
diddn'rt have a large enough spill hole, or wasn't made evenly ansd
caused the spin. but we never had something like that on the way up

4459. Re: [Ballooning] Stabilizing the payload

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-05 04:40:51 UTC
From: Mike Manes
Topic: 4455 Message: 4459

Hi Joe,

Firefox didn't show the movie - just a huge page of garbage text. So I can't tell. I refuse to install the virus-bait WMP on my machine. So all I can infer from the emails is that the payload motion described a spiral - beats me, but could be some weird aerodynamics of the payload package. Making it look like a low-drag bomb might help a lot, in that case.

the video files are shockwave files,,

firefox should play them just fine. I use fox here myself all the time..
and still old netscaps for mail, won't touch IE: Internet exploder or
Out look Viral express.

Can you wantch any you tuve videos? they are all a .flv which is a
streaming shockwave format.

yeah if you had a down to the inch accurate GPS with a continous output
and then plotted it, the payload profile would be indeed a ohhh 4 to 6
foot spiral, like a giant cork screw.

Man flying lawn chair lifted by helium balloons

By JEFF BARNARD ☐ 1 hour ago

BEND, Ore. (AP) ☐ Riding a green lawn chair supported by a rainbow array of more than 150 helium-filled party balloons, Kent Couch took off Saturday in a third bid to fly from central Oregon all the way to Idaho.

Couch kissed his wife and kids goodbye, and patted their shivering Chihuahua, Isabella, before his ground crew gave him a push so he could clear surrounding light poles and a coffee cart.

Then, clutching a big mug of coffee, Couch rose out of the parking lot of his gas station into the bright blue morning sky, cheered by a crowd of spectators.

"If I had the time and money and people, I'd do this every weekend," Couch said before getting into the chair. "Things just look different from up there. You've moving so slowly. The best thing is the peace, the serenity.

"You can hear a dog bark at 15,000 feet."

"He's crazy," said his wife, Susan. "It's never been a dull moment since I married him."

Couch hoped to ride the prevailing wind to the area of McCall, Idaho, about 230 miles east. He travels at about 20 mph.

Late Saturday morning, Couch reported via satellite phone that he had traveled about 100 miles, said Renee Sibley, manager of his gasoline station.

"He was fine, and everything was going good," Sibley said. "He was a little north (of his planned route) but figured he could still make it."

4463. Oregon Man flying lawn chair lands in Idaho!

full story at:

http://www.topnews.in/lawn-chair-balloonist-arrives-idaho-251228

Washington - An Oregon man reclining on a green lawn chair suspended by giant party ballons landed in a horse pasture outside Cambridge, Idaho, at about 2245 GMT Saturday.

American Kent Couch landed safely after gliding some 378 kilometres on the wind above the desert, according to the Oregonian newspaper.

Although Couch ended the day north of his goal of Boise, Idaho he had a successful trip after being released by a ground crew who helped him steer clear of light poles as he left from the parking lot of a gas station he owns in Bend, Oregon.

From: Nick Hanks
Topic: 4410 Message: 4464

Hi Deb,

Here□s the list of EOSS folks who want to order lunch for Friday.

Benji Campbell

Don Fraser

Marty Griffin

Nick Hanks

Daryl Hartner

Glenn Hetchler

Chris Krengle

Steve Meer

Mike Morgan

Larry Noble

Mike Pappas

Miles Pappas

Rob Wright

Rick von Glahn

Fourteen by my count. I go to the website to prepay.

Thanks for setting this up for us.

73,

Nick Hanks

Subject: [GPSL] Final Lunch Orders

Lunch on Friday at William Jewell College will be "create your own sandwich and soup bar"
catered for $10/person. I need a final count of the number of people in your group who will
want to order lunch.

Keith will be adding a Paypal button to the Superlaunch.org site that you can pay through,
but for now i need a list of names of those who want to eat at the college so i can give them
a final estimate for the number to expect.

We need you to pre-pay for your lunches, either through PayPal or send a check to Keith
Kaiser at 6024 N Ames, Kansas City, MO 64151 if you prefer. We will accept orders until
July 9, 2008.

Please let me know if you have any questions or concerns.

Thank you.
Deb Kaiser

Have received about 27 lunch orders. Thanks to all who responded so far and a gentle reminder that we need a final count and payment as soon as you can.

Thanks and hope you all have a great 4th!

Dear friends,

BASE 26 is being delayed by about 24 hours in anticipation of the passage of a slowing moving cold front. New launch date and time is 10 July at 12:30 UTC. Flight will include photometric measurements of the atmosphere, sky polarization, and cosmic ray telescopes.

Hoping to ascend at 750-800 ft/min. Other information on the website:
www.depauw.edu/acad/physics/base

Have a great day!
Howard

4473. Launch of Balloons Using Hydrogen

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-09 15:00:25 UTC
From: Nick Hanks
Topic: 4473 Message: 4473

Hi Keith,

Would it be possible for the two groups using hydrogen at GPSL this year to launch first on Saturday morning? That would give the rest of us using helium a chance to observe their launch preparation process and learn from them. After the two H2 balloons went, the rest would fill and launch.

Deb,

We would like to see that data also. Understand changing data sheets, especially when dealing with attendance numbers. But could you give us some "rounded estimates" on the number of lunches ordered and the number of balloons you expect to be launched? EOSS is launching one.

Thank you.

Good point. So another alternative could be that all the groups using helium that want to watch hydrogen fill and launch could hold off filling until the H2 balloons launch. Then we could all fill and launch. Groups not interested in watching the H2 fills could fill at the same time as the H2 groups.

Nick

To: GPSL@yahoogroups.com
Subject: Re: [GPSL] Launch of Balloons Using Hydrogen

Here's an alternative. If someone wanted to see a hydrogen inflation and launch they could just find one of the groups who will be doing that and observe them. I believe there will be at least three groups using hydrogen. If a helium group isn't interested in watching there's no reason to keep them grounded until after all of the hydrogen flights are launched.

4489. BASE 26 flight complete

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-10 20:32:13 UTC
From: BASE
Topic: 4489 Message: 4489

BASE 26 was launched from the roof of the Julian Center (Lat: 39.64 deg N Long: -86.86 W)on the DePauw campus at 12:30 UTC today. Maximum altitude of 97,000 feet at 14:19 UTC. Average ascent rate of 880 ft/min. Balloon traveled a serpentine path of 78 miles and landing 43 miles at a heading of 106 degrees from Greencastle just southwest of Franklin, IN. Landing time was 15:02 UTC. We had an excellent visual following of the descent from 7000 feet above sea level. Landing was in a corn field near Youngs Creek (Lat: 39 deg 28.29 min and Long: -86 deg 5.11 min). Thanks to the floods of one month ago, the recovery was simplified by walking through the formerly flooded portions of the field. Some of the corn was just about head high, but not yet tasseled.

Data analysis is underway.

See some of you in Liberty for Superlaunch.

Howard

4490. Re: [GPSL] Re: Final Lunch Orders

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-10 22:32:38 UTC

Topic: 4410 Message: 4491

You can make them payable to "Near Space Ventures, Inc".

You can send the checks to me at 6024 N Ames, KC, MO 64151.

Thanks very much.

4492. Re: Final Lunch Orders

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-11 03:21:55 UTC
From: dlkaiser@kc.rr.com
Topic: 4410 Message: 4492

We have a total order for lunch of 35 (WOW Cool!), not all paid yet, but most. We have orders for:

Helium - 3 bottles - Over 3 different groups. - 1 for Nearsys; 1 for Taylor U and 1 for Bill Brown.

Hydrogen - 4 bottles - NSV ordered 2 bottles and Taylor U ordered 2 bottles

Please let me know if there are any questions. We needed 40 for lunch for the price, so we have enough. I know at LEAST 4 people who have not yet given their orders (you know who you are...***grin***).

Cheers
Deb Kaiser

4494. Preliminary Frequency Assignments

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-15 00:09:40 UTC
From: Keith Kaiser
Topic: 4494 Message: 4494

Aeronauts,

Brian Short has worked up the DRAFT for the frequency assignments for GPSL. Please take a look at it (download it) from the web site at superlaunch.org, in the right hand column on the top of the News and Events listing. If you are not represented be sure to contact Brian (kcshorty@...) and get on the frequency list.

Also if you haven't already done so, order your choice of gas and your lunches, these monies are needed to make deposits and such so please do this just as soon as possible.

Near Space Ventures, Inc. will be holding it's monthly meeting on Wednesday and we hope to wrap up all pre-GPSL activities at this time, so don't wait. If you are a late comer and interested in doing a presentation, please send me an email at this address just as soon as you can. Be sure to tell me what you topic is and approximately how much time you will need.

Thank you to all who have done there part for this annual event, I'm really looking forward to it as I know you are, it will be a great weekend.

Keith,

Checked out the freq assignment list as you asked. Looks okay. Will 144.34 be I-gated? If not, would like to go to 144.39. We can time slot on that frequency.

Thanks.

Nick Hanks

From: Mike Manes
Topic: 4494 Message: 4499

Hi Keith,

The AE0SS-11 APRS beacon is slotted at 0:00 and 0:30 if any others want to put
a slotted beacon on 144.34. And the AE0SS CW/DF (Opt 3) beacon is freq agile,
but there doesn't seem to be any problem with 145.600 for the other GPSL birds.

4500. Trimble Copernicus GPS performance on ARHAB balloon flights?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-16 23:25:13 UTC
From: wb8elk@aol.com
Topic: 4500 Message: 4500

During our recent Kentucky Space 1 balloon flight, the student team used a Trimble Copernicus GPS hooked up to a Byonics Microtrak300. However the Copernicus failed to report position above 29,630 feet on the ascent (the Microtrak300 continued to report the last valid position) and didn't start reporting valid altitude and position again until it dropped below 26,638 feet on the descent.

Any ideas as to whether it's a problem with the Copernicus or with the way the Microtrak300 parses the GPS string? Since the wind speed and direction fields were not reporting, it may be that the Copernicus was not sending out the $GPRMC field or there was a parsing problem.

Has anyone else flown a Trimble Copernicus GPS on an ARHAB flight?

Any ideas on this one would be greatly appreciated.....the Copernicus GPS is advertised by Trimble as being excellent for scientific ballooning use, so this behavior is puzzling.

4501. Kentucky Space Balloon 1 flight recap

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-16 23:46:34 UTC
From: wb8elk@aol.com
Topic: 4501 Message: 4501

The Kentucky Space balloon flight 1 went beautifully. This was Kentucky Space's first balloon mission payload NSB-1, built by students from several KY universities and colleges... it had APRS on KI4KXM-11 and a 433.84 MHz CW telemetry beacon onboard along with two Canon 570IS cameras which took some amazing photos.

The 1.257 GHz FM ATV transmitter worked just great (thanks to the wee hour payload-building efforts of Hank W4HTB and Shane N4XWC) with snow-free video received at our command center throughout most of the flight. I also had WB8ELK-11 on APRS. Reception reports of the video signal were received by KA9UVY in Mt. Vernon IL, W8RVH in New Carlisle, Ohio and W8ZCF in Cincinnati, Ohio.

The simplex repeater on 144.34 MHz was quite busy with stations working through it from IL, IN, OH, KY, TN, AL and GA....we even had a few mobile stations from 200 plus miles out working through it. The repeater was an Alinco DJ-S11T (modded with a half-wave dipole) and a Radio Shack Simplex Repeater module.

The balloon reached 91,277 feet and landed southeast of Scottsville, KY in a field near a house (36.6774 -86.1376) The owner called me a few minutes after spotting the payloads across from her driveway and the student teams arrived a few minutes later in hot pursuit.

The National Guard and EMA folks brought out their emergency communication vehicles and we had a first rate air-conditioned ground station with every conceivable HF and VHF radio for our use.

- Bill WB8ELK

PS...the HF telemetry module on 28.172 MHz was not flown due to weight limitations but will fly at GPSL 2008.

4502. Re: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-17 01:08:02 UTC
From: Kent Ochs
Topic: 4500 Message: 4502

Bill,

I can report that the Adler group has had similar problems using the Garmin GPS-18 (which we all know works at altitude) with the Microtrak300 but at much higher altitudes (usually over 80K). Position reports continue to be received sans Altitude. As the balloon descends, altitude reports are received again. The exact cause of this behavior has yet to be determined. I'm beginning to wonder if the problem is in the Microtrak.

It will be interesting to see what other reports you receive concerning this behavior.

Kent Ochs
W9KAO

Subject: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

During our recent Kentucky Space 1 balloon flight, the student team used a
Trimble Copernicus GPS hooked up to a Byonics Microtrak300. However the
Copernicus failed to report position above 29,630 feet on the ascent (the
Microtrak300 continued to report the last valid position) and didn't start
reporting valid altitude and position again until it dropped below 26,638
feet on the descent.

Any ideas as to whether it's a problem with the Copernicus or with the way
the Microtrak300 parses the GPS string? Since the wind speed and direction
fields were not reporting, it may be that the Copernicus was not sending out the
$GPRMC field or there was a parsing problem.

Has anyone else flown a Trimble Copernicus GPS on an ARHAB flight?

Any ideas on this one would be greatly appreciated. ....the Copernicus GPS
is advertised by Trimble as being excellent for scientific ballooning use, so
this behavior is puzzling.

- Bill WB8ELK

NearSys can do either 144.34 or .39. I won't be able to change my transmit times before GPSL and I don't remember what the TT3 was programmed for.

I do have the copies of Nuts and Volts and a BASIC Stamp homework board for a door prize.

4506. Re: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-17 02:35:11 UTC
From: Meer, Stephen
Topic: 4500 Message: 4506

EOSS has flown a Garmin-18 many times as part of our B-LAN system with no altitude, or any other issues. Unit flys connected to an Atmel CPU running our code reporting all NEMA sentences native to the unit.

Seems to point to things beyond the GPS units at this point.

/s/Stephen Meer, K0SCC

Subject: Re: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

Bill,

I can report that the Adler group has had similar problems using the Garmin GPS-18 (which we all know works at altitude) with the Microtrak300 but at much higher altitudes (usually over 80K). Position reports continue to be received sans Altitude. As the balloon descends, altitude reports are received again. The exact cause of this behavior has yet to be determined. I'm beginning to wonder if the problem is in the Microtrak.

It will be interesting to see what other reports you receive concerning this behavior.

Subject: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

During our recent Kentucky Space 1 balloon flight, the student team used a Trimble Copernicus GPS hooked up to a Byonics Microtrak300. However the Copernicus failed to report position above 29,630 feet on the ascent (the Microtrak300 continued to report the last valid position) and didn't start reporting valid altitude and position again until it dropped below 26,638 feet on the descent.

Any ideas as to whether it's a problem with the Copernicus or with the way the Microtrak300 parses the GPS string? Since the wind speed and direction fields were not reporting, it may be that the Copernicus was not sending out the $GPRMC field or there was a parsing problem.

Has anyone else flown a Trimble Copernicus GPS on an ARHAB flight?

Any ideas on this one would be greatly appreciated. ....the Copernicus GPS is advertised by Trimble as being excellent for scientific ballooning use, so this behavior is puzzling.

4507. Re: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-20 05:25:23 UTC
From: Mike Manes
Topic: 4500 Message: 4507

Does the MicroTrak PLL stay locked at low temps?
73 de Mike W5VSI, CTO EOSS

Meer, Stephen wrote:
> EOSS has flown a Garmin-18 many times as part of our B-LAN system with no altitude, or any
other issues. Unit flys connected to an Atmel CPU running our code reporting all NEMA
sentences native to the unit.

> Bill,
>
> I can report that the Adler group has had similar problems using the Garmin GPS-18 (which we all know works at altitude) with the Microtrak300 but at much higher altitudes
(usually over 80K). Position reports continue to be received sans Altitude. As the balloon
descends, altitude reports are received again. The exact cause of this behavior has yet
to be determined. I'm beginning to wonder if the problem is in the Microtrak.

>
>
>
> During our recent Kentucky Space 1 balloon flight, the student team used a Trimble Copernicus GPS hooked up to a Byonics Microtrak300. However the Copernicus failed to report position above 29,630 feet on the ascent (the Microtrak300 continued to report the last valid position) and didn't start reporting valid altitude and position again until it dropped below 26,638 feet on the descent.
>
> Any ideas as to whether it's a problem with the Copernicus or with the way the Microtrak300 parses the GPS string? Since the wind speed and direction fields were not reporting, it may be that the Copernicus was not sending out the $GPRMC field or there was a parsing problem.
>
> Has anyone else flown a Trimble Copernicus GPS on an ARHAB flight?
>
> Any ideas on this one would be greatly appreciated. ....the Copernicus GPS is advertised by Trimble as being excellent for scientific ballooning use, so this behavior is puzzling.

4508. BASE 27 update

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-21 19:23:10 UTC
From: BASE
Topic: 4508 Message: 4508

Dear friends,

Sorry for the late notice, but summer thundershowers with a slow moving front have made for a tough call on the launch time.

BASE 27 will be launched on Tuesday, 22 July at 1700 UTC (1 pm Eastern Daylight Time) from the DePauw campus. Landing is anticipated in the general neighborhood of Shelbyville, Indiana at 19:40 UTC. LiftWin suggests a 100,000 foot burst altitude as we climb at 750 ft/minute.

Will carry the photometric and sky polarization experiments and APRS data at 144.39 MHz.

Hope to post the results late on Tuesday.

Howard

4509. BASE 27 - completed

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-23 01:06:05 UTC
From: BASE
Topic: 4509 Message: 4509

BASE 27 was successfully completed today. Launch at 1700 UTC. Burst at 1845 UTC. Average ascent rate of 900 ft/min. Landing at 1930 UTC. Slow descent resulted in a significantly longer track than predicted. Recovery accomplished by a mowing contractor that took the entire payload with him to his next job (we lost him on the ground), but he returned at 2100 UTC to the landing site with all systems safe. Data analysis and website update will begin in the morning. (www.depauw.edu/acad/physics/base)

I'm modifying our contact information to request an immediate phone call when located.

Next flight at GPSL.

Hope to see some of you there.

Howard

4511. Re: [GPSL] Garmin 18 and MicroTrak300 performance

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-25 14:16:08 UTC
From: BASE
Topic: 4511 Message: 4511

Dear friends,

Our program has had no problems with the TU-301 unit from StratoStar systems on several flights. Their unit uses the Garmin 18 and the MicroTrak 300. The system is completely enclosed in styrofoam. The Garmin 18 is mounted on one end and DB-9 connector is surface mounted on the opposite end. Power is supplied by rechargeable lithium-ion batteries I believe the well insulated nature of the package is good for the MicroTrak.

We have flown other geometries of Garmin 18 and MicroTrak 300 with transmission failures at tropopause altitudes or higher. In one case, the system recovered after warming up at the landing site(atop two 80 foot tall trees) for three hours. Other geometries that failed revealed a working Garmin 18 at landing, even if the MicroTrak was not functioning.

I can't find any fault with the Garmin 18, but do wonder about the temperature performance of the MicroTrak 300. Another experiment for the cold chamber awaits.

Howard

Bill,

I can report that the Adler group has had similar problems using the Garmin GPS-18 (which we all know works at altitude) with the Microtrak300 but at much higher altitudes (usually over 80K). Position reports continue to be received sans Altitude. As the balloon descends, altitude reports are received again. The exact cause of this behavior has yet to be determined. I'm beginning to wonder if the problem is in the Microtrak.

It will be interesting to see what other reports you receive concerning this behavior.

Subject: [GPSL] Trimble Copernicus GPS performance on ARHAB balloon flights?

During our recent Kentucky Space 1 balloon flight, the student team used a
Trimble Copernicus GPS hooked up to a Byonics Microtrak300. However the
Copernicus failed to report position above 29,630 feet on the ascent (the

Microtrak300 continued to report the last valid position) and didn't start reporting valid altitude and position again until it dropped below 26,638 feet on the descent.

Any ideas as to whether it's a problem with the Copernicus or with the way the Microtrak300 parses the GPS string? Since the wind speed and direction fields were not reporting, it may be that the Copernicus was not sending out the $GPRMC field or there was a parsing problem.

Has anyone else flown a Trimble Copernicus GPS on an ARHAB flight?

Any ideas on this one would be greatly appreciated. ....the Copernicus GPS is advertised by Trimble as being excellent for scientific ballooning use, so this behavior is puzzling.

- Bill WB8ELK

4512. GPSL Predictions

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-25 22:32:22 UTC
From: Harry M
Topic: 4512 Message: 4512

I was just checking the predictions as posted on the Superlaunch website.
The results show that the GFSlr MCI data was used, but not which data set.
Is there a way to add this to the data on the right side of the screen?

4513. GPSL Presentation Schedule

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-26 19:26:33 UTC
From: Keith Kaiser
Topic: 4513 Message: 4513

Aeronauts,

I've added the presentation schedule to the web page (superlaunch.org), if any of you doing presentations finds the time too short (long) or at a less than ideal time please let me know asap and I'll try and make adjustments.

For now lets consider this a preliminary schedule, so no one gets too concerned about it being locked in cement.

Good catch Paul. Yes if 1pm is OK with you we'll leave it then.

Thanks..

Hi Paul,

Although I've landed in Kentucky many times over the years, I finally got a chance to actually launch one from there 2 weeks ago...so that makes 19 total states now.....If we fly from a launch site inside of Missouri next weekend, then that will make 20 in total.

Perhaps it would be amusing to amend this record to "Flown Over All States Award" and also perhaps, most states flown over in a single flight. EOSS recently flew over Colorado, Wyoming and landed in Nebraska during a single mission. That was fun. :-)

4518. Good Luck To Everyone Next Weekend!

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-27 14:39:13 UTC
From: Joe
Topic: 4518 Message: 4518

Hi All,

Wish I was able to be there But just not in the cards so to speak. Someday, Someday!

But NSS is doing a flight the following weekend. on August 9th.

We will be flying the payload that was going to fly a while ago, but just could not get a sastifactory landing spot, remember we would have a high possibility of landing in lake Michigan that day no matter what we flew for lift?

Anyway, the usual APRS 144.39 WB9FDZ-11

And our crossband repeater 144/446.

But here's the question for you all. Suggested freqs to use.

In the past on these flights we have used all sorts of freqs. first starting off with ones as far off the beaten path as possible. But then the only people that were able to enjoy it were people involved with the flight, and the people on these e mail lists etc. While still fun, a simple and fun payload like this we'd like to share with the rest of the amateur community.

So almost exactly a year later, we are flying this crossband repeater again. And are trying to decide what freq pair to use. Last year while fun, 99% of the people involved had a blast! And we made 238 QSO's during the flight! BUT it was using a freq pairing that caused a LOT of confusion, 146.52 / 446.000,,,,,,,

While 99% of the people that used it that day enjoyed it greatly, there were that 1% that slammed us greatly for using those freqs even though it was only for two hours, Then there were the ones that no matter how many times we explained to them that it was a cross band repeater at 100,000 feet and NOT A HUGE BAND OPENING, they were calling people like after we'd sign with someone, they'd go,

WB9SBD THIS IS K9XYZ GO UP to 146.55 I'LL CALL YA. and stuff like that.. they just no matter how many times we explained what was going on they still thought it was a huge band opening , not a 2 watt repeater on the equivalent of a 100,000 foot tall tower!

So obviously we don't want to use those call freqs again, but a secondary pair so to speak, that are like secondary splinter freqs, like 146.52. has 146.55 and 146.58 stuff like that, but, I can not seem to find freqs that are secondary freqs like that but on 70 cm. Ya know a slinter freq for 446.000.

While it won't be nearly as popular as the 146.52 / 446.000 pairing, it still at least will get a few more people that do not know about the flight a chance to play with it.

I've contacted our local Repeater co-oridinator group fopr suggestions, and have had the same result I've gotten from them for the past 20 years ZILCH!
any suggestions? for a two hour experiment?

NSTAR has used 446.30 MHz for its simplex repeater and 147.585 MHz for SSTV without complaint. We did a couple of flights on 446.00 and had about 50% "ooh, that's cool" and 50% "why are you on the calling freq". After 446.00, we used 446.10 and found some 9600 was on the frequency (Des Moines area?). 446.30 MHz has been clear.

Our use of 147.585 MHz has been transmit-only, so I don't know if there are regular users of that frequency within our footprint or not.

Hi Mark,

Yeah thet is the main problem with the 70 cm band, you just have no clue as to what is on any freq, sooo many un published links and such.

On 2 meters (birdie allowing we will probably choose 146.55, but the 70 cm freq, ya would think there would be somewhat like 55 and 58 are ya know alternate secondary freqs but on 70 cm.

soo much a bummer!

Joe NSS

4522. Re: [GPSL] simplex and crossband frequency choices

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-27 20:19:09 UTC
From: wb8elk@aol.com
Topic: 4522 Message: 4522

Hi Joe,

I've used 144.36 MHz for an input and ouput (simplex repeater) with no complaints.

If you also fly ATV, then 144.34 is a good choice since that is the ATV coordination frequency....if no ATV then that's not recommended.

I've also seen 146.46 flown as well with good results.

As to the 70 cm band.....I've had good luck with 446.025 MHz...or 445.075.

If your crossband radio can do splits on VHF and UHF sides, then might consider setting it up to work a pair of repeaters, with the trustees' OK of course. ANSR runs its on IRLP repeaters and gets out all over the world!

Now that is a possibility hmmmmm,, yes it can do that easily,, wow,
hmm from southern Wisconsin, I wonder in less than two weeks we could
find interested parties, he he he

Joe But yes a cool idea, we could easily link a ohio repeater to
something way out west,, or anyone still open fopr a linked EBBE
flight for the 9th?

4526. Re: [GPSL] Good Luck To Everyone Next Weekend!

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-28 00:11:31 UTC
From: Michael Gray
Topic: 4518 Message: 4526

The ANSR (Arizona) group has flown a cross band repeater since our second flight back in 2001 without any problems. No one has ever complained. We did select frequencies in the experimental portions of the 2 meter and 70cm band. There is one simplex node in VHF that is 10KHz off our uplink, but the operator just turns off his repeater during the flight. He likes the balloon stuff, so no problem there. I have a dedicated IRLP node that is configured to work cross band with the balloon. So we get lots of check in during the flight.

Uplink is 145.56MHz PL 162.2
Downlink is 445.525MHz
APRS Tracking 445.950MHz

Here is an overview of the setup.

http://www.kd7lmo.net/ground_irlp.html

One difference from most groups is we run 70cm APRS beacons. It makes the antennas smaller on the payloads, so we've stuck with the setup. We have a couple digipeaters on the ground to go from UHF to VHF on 144.390. We even have a couple stations now that point a UHF beam towards our flights and directly transfer to the APRS Internet feed.

So a possible suggestion....

Harry - I did get your helium and lunch orders and the helium and lunch was ordered for you.

I don't know about sizes, we were getting all the same size bottles of helium. As mentioned earlier, the price is $132 per bottle.

You can either pay on the superlaunch.org site using PayPal, or send a check made payable to Near Space Ventures, Inc and send it to me at 6024 N Ames, KC, MO 64151.

Thanks and see you soon!

Hi Guys,

What was the make and model of the still camera that everyone was raving about not too long ago?
Joe

A few groups, including NSTAR, just started using the Canon PowerShot A560. However, any camera compatible with the CHDK firmware (http://chdk.wikia.com/) will make a good balloon camera due to the scripting abilities of the firmware (does not require hardware mods to the camera).

Hi mark,

anyone have a list of cameras that will work with that firmware?

Joe

Hi All:
Like Joe, I wish I were able to go this year but a work event has sidelined me. Hope to go in another year.
Since I am just reading my email here I would say an initial vote would be 146.565 for VHF (several cw and voice beacons have used this frequency in the past and would probably be off the beaten path enough you would avoid most of the general chit chat on 146.520 and only run onto a few people who use that for radiolocation and such. On UHF possibly 446.500?
Others may have an input but what ever you land on Joe let us know and I hope to try and work your balloon from the south side of the Cheddar curtain.

Subject: [GPSL] Good Luck To Everyone Next Weekend!

Hi All,

Wish I was able to be there But just not in the cards so to speak.
Someday, Someday!

But NSS is doing a flight the following weekend. on August 9th.

We will be flying the payload that was going to fly a while ago, but just could not get a sastifactory landing spot, remember we would have a high possibility of landing in lake Michigan that day no matter what we flew for lift?

Anyway, the usual APRS 144.39 WB9FDZ-11

And our crossband repeater 144/446.

But here's the question for you all. Suggested freqs to use.

In the past on these flights we have used all sorts of freqs. first starting off with ones as far off the beaten path as possible. But then the only people that were able to enjoy it were people involved with the flight, and the people on these e mail lists etc. While still fun, a simple and fun payload like this we'd like to share with the rest of the amateur community.

So almost exactly a year later, we are flying this crossband repeater again. And are trying to decide what freq pair to use. Last year while fun, 99% of the people involved had a blast! And we made 238 QSO's

during the flight! BUT it was using a freq pairing that caused a LOT of confusion, 146.52 / 446.000,,,,, ,,

While 99% of the people that used it that day enjoyed it greatly, there were that 1% that slammed us greatly for using those freqs even though it was only for two hours, Then there were the ones that no matter how many times we explained to them that it was a cross band repeater at 100,000 feet and NOT A HUGE BAND OPENING, they were calling people like after we'd sign with someone, they'd go,

WB9SBD THIS IS K9XYZ GO UP to 146.55 I'LL CALL YA. and stuff like that.. they just no matter how many times we explained what was going on they still thought it was a huge band opening , not a 2 watt repeater on the equivalent of a 100,000 foot tall tower!

So obviously we don't want to use those call freqs again, but a secondary pair so to speak, that are like secondary splinter freqs, like 146.52. has 146.55 and 146.58 stuff like that, but, I can not seem to find freqs that are secondary freqs like that but on 70 cm. Ya know a slinter freq for 446.000.

While it won't be nearly as popular as the 146.52 / 446.000 pairing, it still at least will get a few more people that do not know about the flight a chance to play with it.

I've contacted our local Repeater co-oridinator group fopr suggestions, and have had the same result I've gotten from them for the past 20 years ZILCH!
any suggestions? for a two hour experiment?

Hi Joe,

EOSS has flown the A560is twice now, most recently last Saturday on EOSS-130,
where it worked like a charm. Rick N0KKZ has details at:
http://www.eoss.org/hardware/canon_a570is.htm

Hi Mike,

the code on the page, do you know who made it? was it u?

or who, reason asking is, the camera that is coming is one step below
your 570 we have a 560 coming,

from what it looks like the only difference is slight, like image
stabilization the 570 has.

what ya think?

Brian it appears that only myself and Bill are using 144.99.

I had wanted to TX twice a minute but the slot of 18 would put me on top of Bill. I want to change my second APRS to K0NMS-1 / 144.99 /using slot 25 & 55.

If this change is going to cause anybody else trouble let me and I can change as needed.

Cheers,
Nick

Hi Joe,

Rick N0KKZ, our Web Wunderkind and Pundit of Pix, developed the CDHK code shown on the web site.

Now, each model of the Canon is a little different, and I'm not sure if the A570is code will run on a A560. But Rick might be able to give you some pointers.

And OOOPS! I just noticed that I misspoke re the Canon model we fly: it's the A570is, not the A560.

Brian, I asked if .36 was going to be IGated and if it is that I prefered that freq for the same reason as Nick. The IGate'g is not that important. I also would like to beacon twice a minute. I am using a TTIII and if I slot it only allows one bcn/min.

I've been running BT predictions against the NSV online predictor and they never seem to jive. The latest, using MCI GFSx 114hr 1200z data, I get 8 miles difference using the same flight profile.

Anyone have any thoughts or comments?

Hi Harry,

Are you blending in Radiosonde data for the upper level winds on Balloon Track....if so, the stratospheric winds are large compared to the lower winds this time of year and there will be a difference and since the Web-based Balloon Track only uses GFS wind models, it stops at 86,000 feet or so with the wind data and extrapolates on up which works just fine most of the year, but during July and August it's better to blend in the radiosonde data with the PC version of Balloon Track.

If you're just using the GFS wind data on your Balloon Track program, then I would expect that they should be identical since they use the same algorithms....I assume you've changed the Weather Station ID to MKC or MCI (for Kansas City) on the Web-based Balloon Track?

The program is called JPGVideo. The original site doesn't seem to
have it anymore, but a Google search should give you some download
locations.

You will probably need to download some better codecs, but I forget
where I got them. The Windows Media Video version 9 codec is the one
I normally use.

4553. Vending available at GPSL Conference

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-29 02:48:45 UTC
From: dlkaiser23
Topic: 4553 Message: 4553

Based on the note below from Dr Geilker at William Jewell, i will be bringing a cooler and water. You may choose to bring your own pop or water to drink during the conference. Ice tea and water will be provided with lunch. The vending machines are kind of high, so take this into consideration. Thank you.

"Deb, there's a Coke machine on the (G) floor below the ChemBio Lecture Hall (WSC 107) and it has several Coca-Cola products, all in 20 oz bottles and all at $1.25 !

There are no regulations on bringing your own food into White Science Center (though there are for the Student Union -- wouldn't want to compete with the resident catering service), so
bring in your own cooler if you think it's worth the savings. (Just no alcohol in it.)

There is another vending machine with "snacks" at equally high prices for the desperate."

4557. 2 meter Mag Mount antenna

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-30 13:21:02 UTC
From: BASE
Topic: 4557 Message: 4557

Dear friends,

My 2 meter magnetic mount antenna (the little MFJ 1721) has suffered the partial disconnect of the coaxial cable from the magnetic base. It still appears to be an acceptable receiver, but I'm not certain about the durability. I may receive a new antenna from MFJ today.

In the meantime, does anyone that is going to GPSL have an extra 2 meter mag mount antenna that I can borrow for Saturday? I can use either a PL-259 or a BNC connector.

Thanks in advance,
Howard

Date: 2008-07-30 14:36:16 UTC
From: Keith Kaiser
Topic: 4560 Message: 4561

We thought about making formal plans for both nights and elected to give people a chance to have some time to themselves or to arrange impromptu outings if they wish. Thursday evening is of course the observatory tour as well so we didn't want to infringe on that. Saturday is the victory dinner at Uno's and that should be lots of fun as usual.

There are a lot of restaurants in the area, so putting together a group and deciding where to go should be an easy deal. Additionally KC has lots of things to see and do so if individuals or groups want to get out and see it not scheduling too many GPSL events supports this too.

Great question!

KC or Burst!

4562. Liability

Yahoo group: GPSL (2002 — 2008)
Date: 2008-07-30 18:33:06 UTC
From: Earl Foster
Topic: 4560 Message: 4562

Is there such a thing as liability insurance against personal injury and property damage for this type of activity? I have been asked that question on several occasions and I usually answer "no" but I have been asked to assist a local university with their first launch and they are asking the same question. The school is skidish about getting students involved due to some events that occurred in the past and before I tell them "no" I thought I would check to see how others handle that question.

Good luck with the GPSL, wish my payload would have been ready. Maybe next year.

I have a $1 million liability rider attached to my homeowner's policy that will cover any of my family's activities that causes harm to others. It costs about $225 / year. This insurance covers my kids driving their cars, my high power rocket activity, my boat...anything I do that causes harm to someone else (so long as it's a not-for-hire activity). Check with you insurance agent.

I'm not sure how your balloon flying with a university would affect the coverage.

From: Michael Gray
Topic: 4560 Message: 4567

For personal liability you can add "General Umbrella Coverage" to your home owners policy. For about $250 / year you can get $2.5M coverage for stuff like ballooning or being on the board of your HOA. You'll probably still get sued, but the insurance company is there to backstop the claims.

If it is part of a school or university flight, they generally work out the coverage. I know for our Space Grant flights in Arizona, the state puts up something like a $200-250M policy for any mishaps. You as a balloon club member may still get litigated, but the general liability policy would cover you.

Welcome to Liberal Lawyer America!

When I was the faculty advisor for ARSAT (Amateur Radio Society at Texas Tech U), the group was covered under the umbrella of student activity insurance policy (double check the requierements, i.e. filing the activity in advance, show the predicted travel, submit copies of student's driver's license etc). Costs nothing as the group policy already purchased on student activity budget.

Hope that helps,

Parking;
Parking will have to be in the lower parking lot immediately across the street from the White Science Center, this makes it about a 100 yard walk to the building. Sorry about that guys the upper lots are for faculty and as of now I have not been successful at getting us permission to use them. Lets all take a way-back look at our college days and remember that walking on a campus is the norm... LOL

Friday Conference;
The conference all day Friday is in Room 107 the Francis Lecture Hall. I'm sitting there now and the first thing I notice is that there are very few electrical outlets. I'll bring all the extension cords and power cords I have but if you have one you like be sure to bring it too.

Getting Here;
There is a detour if you are coming off of I-35 that actually makes the trip to WJC easier. Take the detour but when it heads you back toward town, ignore it and stay on the road it'll take you right to the college. You turn left into the college, you will see the White Science Building on your left, parking is immediately across the street.

4586. Re: [GPSL] Liability

Yahoo group: GPSL (2002 — 2008)
Date: 2008-08-01 04:02:41 UTC
From: Mike Manes
Topic: 4560 Message: 4586

In many states, including Colorado, members of charitable non-profits, such as EOSS, enjoy automatic liability limitation, exclusive of gross negligence or illegal activity. EOSS has tried in vain to get liability coverage for its ARHAB operations - well, not ENTIRELY in vain - Lloyd's bid $1M / yr premiums. Seems the actuarial data on unmanned ballooning is a bit sparse.

P. Suryono Adisoemarta wrote:
> When I was the faculty advisor for ARSAT (Amateur Radio Society at Texas Tech U), the group was covered under the umbrella of student activity insurance policy (double check the requierements, i.e. filing the activity in advance, show the predicted travel, submit copies of student's driver's license etc). Costs nothing as the group policy already purchased on student activity budget.

MFJ uses thoroughly rotten coax for that mag mount. The coax on mine shorted thru a crack in the dielectric. Recommend replacing the coax with something more robust, like RG-142, which is bulletproof! And suggest placing a 1/8" ty-rap around the coax entry point to the mag mount base. So, wotcha expect for a $15 dual band mag mount, eh?

It's probably just as well I didn't plan to go this year, as I'm starting to get a cold that if it's as bad as my wife's will be pretty nasty by tomorrow. Good luck to all the crews. I'll probably switch my home rig to one of the non-.39 APRS frequencies for additional IGate support.

I tried to run the online predictions at nearspaceventures.com and was unable to get a Google map output. The launch coordinates for the predefined sites are positive longitude I noticed - even after fixing that, I still don't get any display.

4591. WB8ELK frequency changes for GPSL balloon flight

Yahoo group: GPSL (2002 — 2008)
Date: 2008-08-02 05:39:36 UTC
From: wb8elk@aol.com
Topic: 4591 Message: 4591

ATV on 439.25 will not fly....however, EOSS will be flying ATV on 426.25 MHz horizontal polarization....you can tell when the balloon is coming into range when you hear their packets on 144.34.

I'll be flying a simplex repeater on 147.525 MHz which is just below the crossband repeater on the EOSS balloon on 147.555.

I'll also have a 433.92 MHz AM RTTY transmitter and the HF transmitter on 28.172 MHz.

WB8ELK-12 APRS will be on 144.34 MHz and WB8ELK-11 on 144.39.

Also new on the list is a 147.435 MHz Audio CW FM beacon from the ORB balloon - KC5TRB.

- Bill WB8ELK

Paul,

Congrats on your marriage and your acceptance for a PhD program. KU
has flown at least a couple of flights, but I think it's been 2-3
years since they've done it (flew as K0KU-* I believe).

NSTAR is planning a flight somewhere around the 3rd or 4th weekend in
September. If you're interested, come on up and we'll do a pair of
flights from up here.

Looking forward to GPSL 2009. Sorry I couldn't make it for 2008 but
just too much going on in July this year.

With respect and kind regards...

AMATEUR RADIO GROUP TO FLY MEMORIAL BALLOON FLIGHT FROM HILLSBORO AIRPORT
```

A Memorial Flight for club member John Newman, Cindy Newman, son JW Newman has been scheduled. John was our pilot and flew the mission□s chase plane. It also served as our repeater for recovery ground operations. The Newman□s passed away in a tragic plane crash a few weeks ago.

The Newman□s mission held by the North Texas Balloon Project (NTEXBP) is planned for launch about 8:30 am on *August 9, 2008* from the municipal airport in Hillsboro, Texas, just south of Fort Worth and Dallas. Two payload packages containing sensors and amateur radios will be carried to nearly 100,000 feet in about 90 minutes by a Helium balloon and return via parachute in about 50 minutes. Mobile recovery teams will use position reports from the onboard GPS and APRS transmitter on *144.390 MHz* and radio direction finding techniques to recover the payloads.

```
Pre-launch activities will begin about 7:00 am with the HF Launch Net on
*7260 +/- 5
kHz, LSB* beginning around 8:00 am. A cross band repeater will be
activated soon after
launch. Uplink is *445.800 MHz* and downlink is *147.560 MHz*.
Handheld VHF radios
and scanners can receive the downlink easily. At the peak altitude ham
radio operators
from Texas, Oklahoma, Arkansas, Louisiana, and Kansas can contact each
other using
the cross band repeater.

The radios used normally have a range of about 25 miles, but that range
will be extended
to about 500 miles at the peak altitude. At the peak altitude, the
curvature of the earth is visible. Digital video is recorded for later
playback. APRS packets transmit the balloon's location about once a minute.
```

NTEXBP's Tommy Davis said, "This is being done because the Newman□s are in our thoughts and they meant so much to our community.In past

operations we did the launches for fun and the enjoyment of flight. It involves many different facets of amateur radio and thus a project that many types of amateur radio operators can enjoy together.☐ There is also an educational component utilized by scouting groups, because it involves orienteering and can be counted toward several different merit badges, as well as by teachers for science experiments. Davis said, ☐Area scout troops are invited along with all that are interested.☐

In the event of unfavorable weather or poor jet stream conditions, the launch will occur at a later date. Be sure to check www.ntexbp.org <http://www.ntexbp.org/> or www.w5sjz.net <http://www.w5sjz.net/> and other Ham Radio forums and news sources for later information.

The public is invited to come out to the Hillsboro Municipal Airport, located at Exit 3 on
Interstate Highway 35W, to watch the launch.

North Texas Balloon Project is a group of amateur (HAM) radio operators from Fort Worth and Dallas and has launched balloons from Cleburne, Clifton, and Hillsboro airports since 1991. This is the first launch during this year and is funded by the amateur radio operators associated with the North Texas Balloon Project.

Operator☐s and Technical Data to follow at www.ntexbp.org <http://www.ntexbp.org/> or www.w5sjz.net <http://www.w5sjz.net/>.

Please forward to interested Hams and ham communities. I would also appreciate any announcement that could be made on local repeaters during allotted calls for announcements. Thanks as always.

Hillsboro guys,

The flight this weekend August 9th,

The crossband repeater 445.800 / 147.560

is it a system that goes BOTH WAYS?

IE: no signals nothing happens,

If the 445.800 reciever hears something then it re transmits what it
hears on 147.56

and visa versa,

what it hears on 147.56 it re transmits onto 445.800

Yes? No?

From: Harry M
Topic: 3356 Message: 4602

Many, many thanks for all the hard work for making GPSL08 a huge success! I had a great time and so did Mark & Carol. They are looking forward to GPSL09 as am I. It was great to see everyone again and to make some new friends. I hope everyone had a safe and uneventful journey home.

GPSL ORB-24 APRS Failure Anaysis

The APRS on ORB-24 failed on ascent. The last altitude reported was 41552 ft. The batteries are still in good shape as is the radio and GPS. It seems the TinyTrack III failed. I connected the pc to it and several perameters were missing or changed in the Primary config. The "Callsign" and "Digi Path" are blank. The "Symbol" field has changed from O to -, "Send only Valid" is checked (normally NOT checked), both "Mic-E" boxes were checked (normally NOT checked), "Time Slotting" checked and set at -34423 (no slotting used on this flight). The Secondary config had not changed. I will investigate further and try to determin the cause.

I had this happen on ORB-7 the EBBE flight and it was caused by breaks in the pcb traces under the DB9 connector. That will be the first area of investigation.

Hi Harry,

Hmmm ... it's possible that there was some RF getting into the low-level sigs on the TT3 PCB. It has a very puny ground trace distribution. I gussied up the ground on the K0YUK-11 APRS Lite beacon using a grid of bus wire, mounting it over a ground plane and using a J-pole (minimum counterpoise current geting back inside).

Harry,

I had this failure happened to the second flight of ARSAT (this was around 2003), when we were doing payload integration test on the ground. Somehow TT3 was very susceptible to RF power from the nearby beacon transmitter. After several minutes of beaconing, when we're ready to conclude the test and wrap up to be ready for tomorrow's flight, the beacon quit working. After we dismantle the payload and plug a serial cable to it, we found that the config got complete trashed (similar to yours, blank callsign and path, and weird parameters on the other fields).

At that time we were not sure what caused the problem (whether the TT3 by itself, or the close proximity to another transmitter), so that night we had to scramble, replacing the TT3 with an OpenTracker1 rev3, and, built another enclosure to house the beacon transmitter. That flight went up successfully.

Harry,

I had the same thing happen last year but it happened the night before the flight. I thought that PIC's flash had given up. I reflashed it and have been using it since then with no problems.

I reprogrammed the PIC and the tones are not what they should be, they are lower, almost like 300 baud, but not. The 300 baud box is not checked. I replaced the PIC with a spare and the TT works just fine. So it seems that the PIC is kaput. This TT has flown for at least 15 flights and if there was an RF problem I would suspect the 10m beacon which has not flown before. The very top of the 10m antenna was 4ft below the TT and is very low power (QRPppp). I will do some close proximity testing to see if I can wipe out the PIC.

Thanks for the input!

Hi Joe,

My Turbo XT (12 MHz!!) reads once per sec full NMEA sentences at 4800 baud from a Jupiter just fine to ProComm under DOS. Not sure if Vista can handle it, tho. The terminal program may be the biggest bottleneck, however. Some are such resource hogs that they can't keep up.

Hi Joe;

I use PuttyTEL, an open source (free) terminal emulator on windows 2003 server, and it works great at 9600 baud. Also runs on many other versions of Windows. Note other versions of PuTTY include support for TELNET and related protocols, which you probably don't need meaning that PuttyTEL has the least overhead of the collection.

You can download it from http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html, or I can email it to you (300 KB).

4622. WB8ELK balloon HF transmission reception reports?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-08-06 01:06:56 UTC
From: wb8elk@aol.com
Topic: 4622 Message: 4622

Did anyone listen for the WB8ELK HF transmitter shortly after liftoff or shortly before landing?

Ralph, Do you know the approximate times when you heard my HF transmitter on 28.172 MHz?

I was using the Trimble Copernicus GPS unit on it for the first time (it works fine with the Garmin GPS18-LVC in previous flights)....it was working prior to liftoff and was working fine after landing but I didn't have an HF rig in the car to check on it during the flight. The first time we flew a Copernicus with a Byonics Microtrak300 it stopped reporting position and altitude above 29,000 feet and started to work again upon descending below that altitude.....so I'm wondering if that is the same thing going on....In this new version of my code I have it looking for the GPS timestamp in order to start transmission at the top of each even minute so if the GPS stopped working, then it would've been key down with no telemetry....I'll put a GPS error trap in the next version of the code....Mark KA9SZX also heard a good signal on the carrier in Macomb IL but wasn't close enough to hear it below 29,000 feet....so hopefully someone closer in was able to copy it.

- Bill WB8ELK

Windows Vista did away with Terminal server so I use Parallax Serial Terminal program to monitor my GPS. The Stamp and Propeller have no problem capturing strings. If you are interested the software is free and can be download at http://www.parallax.com/tabid/442/Default.aspx.

To: GPSL@yahoogroups.comFrom: don.fraser@...: Wed, 6 Aug 2008 00:44:18 +0000Subject: RE: [GPSL] pROCESSOR sPEED?

Hi Joe;

I use PuttyTEL, an open source (free) terminal emulator on windows 2003 server, and it works great at 9600 baud. Also runs on many other versions of Windows. Note other versions of PuTTY include support for TELNET and related protocols, which you probably don't need meaning that PuttyTEL has the least overhead of the collection.

You can download it from http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html, or I can email it to you (300 KB).

Hi Joe,My Turbo XT (12 MHz!!) reads once per sec full NMEA sentences at 4800 baudfrom a Jupiter just fine to ProComm under DOS. Not sure if Vista can handleit, tho. The terminal program may be the biggest bottleneck, however. Someare such resource hogs that they can't keep up.73 de Mike W5VSIJoe wrote:> hI ALL,> > hEY A QUESTION FOR YA, Oops caplock,, ok anyway,,> > To read the data string from a typical GPS like the Garmnin hockey puck.> > A processor, what do you all think the minimum speed would need to be > to read it well?> > Joe WB9SBD> > ----------> > Yahoo! http://www.sippican.com/stuff/contentmgr/files/3e8052902595d3629c7b01ca9f4201b0/sheet/mark2.pdf

My question is has anyone or is there a method to decode data from a weather balloon and possibly get the GPS data that is being downlinked, because I read they get like 20% of there balloons back and if there was an easy way to track and recover a NWS balloon, I would not mind doing it a couple times a year just for the fun of it. I would have figured with most NWS offices being hams they should incorporate a APRS type device so your average APRS user could say hey a weather balloon just came down a mile from the house, let me go retrieve that for the NWS. But maybe I am just wishing we have 100 plus balloons to watch every day on APRS. hahaha

But I would appreciate any comments on if anyone given thought to attempting recovery of NWS balloons and how is the best way to go about it. I believe the NWS tracks it only up to 60 to 70K on the way up and then they don't monitor the location any further.

Harry,

Sorry, I didn't mean "flash the code", I meant reset "start from scratch with ttconfig.exe and save it again.

I also stopped using a linux version of the ttconfig as it was not getting it right. I use the winbloz version under wine and haven't had any problems.

I found a Vaisala weather sonde along the road a couple weeks ago in
Arizona.

http://www.vaisala.com/weather/products/soundingequipment/radiosondes/rs92

The internal bar code shows a Model RSS921. Perhaps Mark might know if
this is a NWS Sonde or someone else's. This appears to be a Radar or
Loran-C tracking device. Their brochure shows a variety of models. The
GPS variant has a Quadrifilar antenna. The model I found has a long
wire antenna. The center conductor is an insulated wire and it is
spiral wrapped with a bare piece of wire that was connected to ground
within the module.

The internal electronics use a PIC controller, a couple hex inverters,
and an RF chain.

Not all of the NWS offices have converted to GPS sondes, but I believe conversion will be complete in 2009. Also, NWS is not the only organization that sends radiosondes, so it may not be one of theirs.

Google didn't have anything specific on a RSS921 model from Vaisala - the RS92 series has several models including a GPS one.

As far as tracking a sonde goes, I believe that DFing by signal is probably the way to go for hobbyists (there are some folks who do that, perhaps even on this list). The GPS location is not fully decoded on board the sonde - I think the pseudorange numbers are sent down and location computed on the ground. I suppose you could purchase your own radiosonde receiving system and copy the data directly, but that's probably a five-figure investment.

NWS tracks the sonde to burst or LOS. Burst would normally be around 105,000 ft.

Yep, here is mine. It has some hole in it for out payload (ae0ss-11) so expect to see that for your payload too. I imagine I drove under the null for a while don't really know what happened.

I'm working on a recap for this flight so when that goes up this file will appear there but have a different name, something like "eoss131_ae0ss-11_log.txt". But I won't edit it other than the name.

In a hurry to change the package container for
Balloon #2,I didn't get the package attached as well as I should
have and the package separated from the balloon and came in hot from
39,868 ft in less than 8 minutes. That comes out to 4,875 ft/min or
greater than 55 mph. There were 5 transmitters in the package (3
BRB products) and my Rino plus Jerome's transmitter. Believe or not
but they all survived and even the Rino did Ok.

Here are a few statistics from the flight:
Balloon #1 K0NMS-11 on 144.99
It was launched 2nd at GPSL filled with hydrogen
This is based on the Rino Data that is stored onboard.

Distance Balloon Traveled (actual path) = 53.5 miles
Time of Flight (aloft) = 1 hrs 56 min
Average Speed of Balloon = 28 mph
Maximum Altitude (by Rino) = 92,655 ft
Time to Max Altitude = 71 min
Avg. Rate of Ascent = 1292 fpm
Time of Descent = 45 min
Avg. Rate of Descent = 2035 fpm

Maximum Speed on Ascent = 76 mph at 42,391 feet
Maximum Speed on Descent = 75 mph at 41,986 feet

Here are a few statistics from the flight:
Balloon #2 K0NMS-7 446.175
It was launched 1st at GPSL filled with hydrogen
This is based on the Rino Data that is stored onboard

Distance Balloon Traveled (actual path) = 20.6 miles
Time of Flight (aloft) = 0 hrs 38 min
Average Speed of Balloon = 32 mph
Maximum Altitude (by Rino) = 39,868 ft
Time to Max Altitude = 30 min
Avg. Rate of Ascent = 1300 fpm
Time of Descent = 8 min

Avg. Rate of Descent = 4875 fpm (free fall- no chute)

Maximum Speed on Ascent = 112 mph at 39,868 feet
Maximum Speed on Descent = 94 mph at 10,274 feet

4639. RE: [GPSL] GPSL Pics in Progress

Yahoo group: GPSL (2002 — 2008)
Date: 2008-08-07 03:07:14 UTC
From: Nick Hanks
Topic: 4618 Message: 4639

Hi Paul,

A quick summary on the EOSS flight at GPSL.

We had six payloads under a 1200 gram balloon for the flight: The payloads were: a CW beacon/cut away, a B-LAN that sent GPS-derived position and altitude data via a wireless connection to the ATV, the ATV which looked up and down, a Canon frame camera, a cross-band repeater/APRS beacon (UHF up and voice and APRS down on 2 meters), and an APRS module. We also flew a light weight version of the balloon cut away device W5VSI briefed at GPSL 2006 in Hutch.

The EOSS balloon (AE0SS-11) reached a maximum GPS altitude of 88,759 ft. It landed 28.9 miles from the launch site. All the payloads functioned correctly. KB0YRZ recorded the ATV signal on the move and has imagery of the balloon in final descent.

The balloon was traveling northwest near the ground then the ARPS module caught a tree. The rest of the payload string then draped itself over the tree with the parachute being caught up in a smaller tree to the west of the bigger tree. After receiving permission from the land owner to enter the land, we pulled the parachute down. But the rest of the payloads were too high to reach, and the tree was a hedge tree and covered in thorns. One of our group borrowed a 30 ft. extension ladder from a nearby house. That allowed us to reach the other payloads, and they were freed one at a time. Removing a flight string from a tree was a new experience for almost all of us. Seems EOSS had put one other balloon in a tree in the early ☐90s in Boulder, but it was fetched by the fire department and put under a new balloon and flew fine the same day.

After securing the payloads for travel back to Denver, we called the other groups asking if we could be of assistance. A number of the groups welcomed our help.

We had nine vehicles supporting the track and recovery of the balloon lead by WAØGEH, the Alpha for the flight. One tracker made HF contact with Denver during the flight. We also run two mobile I-Gates that sent not only the packets of the balloons on 144.34 MHz, but also the trackers as we fly a KPC-3 TNC on our APRS module, and it digipeats the trackers who beacon APRS on 144.34 also.

A quick after flight review of the Canon pictures showed several balloon-to-balloon images of the three balloons that launched when we did. A complete rundown of the flight will be posted on our website www.eoss.org <http://www.eoss.org/> . Look for the EOSS-131 data. The video from the ATV will be put on the site when it☐s been reduced to the ☐good☐ stuff.

73,

Nick

Paul,

The BASE 20 and HALO presentation PowerPoints can be downloaded from superlaunch.org next to their names.

The dog tracking was less than completely successful, more details will take some time to compile.

Taylor and Nick Stick/Jerome launched Hydrogen balloons.

We all launched from the Maybee Center practice field at William Jewell College.

Nick and Jerome do not have a web page.

> One of the hydrogen flights was Taylor. Who was the other?

Nick Stich & Jerome flew 2 hydrogen balloons.
Balloon #1 was K0NMS-11 / Rino 110 ID = NMS-1
Balloon #2 was K0NMS-7 / Rino 110 ID = NMS-2

> So Nick Stich and Jerome launched together? Do either of you have
>a web page?

Yes Nick & Jerome launch together.

Neither Jerome or I have a web page. I sometimes post to the old
Habitat_Skylab forum files section. I use the data stored via the
data logging feature of the Rino 110 for my data reduction. I use
the
Garmin MapSource software and download the data.

Since so many people don't have the Garmin MapSource software I have
gotten into the habitat of using Excel to present my data. It
allows
me to place screen shots from the MapSource software and to also
provide the raw data data from the Rino. I typical have somewhere
between 1500 and 2000 data points from the Rino 110. I then plot
this
data.

If others are intersted I would be more than happy to provide the
Mapsource files and/or the Excel files for my GPSL 2008 Flights.

Hi Joe,

Before we started flying our fast release on all of our flights, I brought home 6.0 lb of latex shards from a 3000 gm (6.6 lb) bag. Man! Did that play havoc with the parachute aerodynamics! Pretty snappy descent on that one - like 20 minutes from over 90K'.

Since then, the most latex we've brought home is a thread or two on the shroud lines. Guess a burst does blow shards at least 20 ft downward, since that's the distance from the balloon neck to 'chute skirt on our flights.

The new "lite" fast release designed for 1200 gm flights weighs just 105 gm and worked dandy on EOSS-131 out of GPSL '08.

I have a question, Using a Microtrak300 in the config software under tims slotting,, i have never done that before. but I'm going to be flying two tracking payloads,
1- that i know works for sure,
and the other will be testing the GPS unit for altitude use.

so obviously if both work great! but i want to keep them from stepping on each other,

so when I checkmark the time slotting box it then asks for a transmit offset number,

what is that number mean? default looks like 15,

15 what?

Hi Joe,

Once your GPS gets a lock, which will include the time, the time slot number is the seconds past the minute GPS time. Bear in mind that with time slotting you will only be able to xmt once a minute at the given seconds past the 0 minute.
The 15 that you are in question about would make the MT xmt at 15 seconds past the minute, every minute.

There is a point at 125 seconds and over, in the time slot offset, where it will return a -65411 value. Try 125 for the offset, save it then load it and you will see. I don't know what would happen if you set the offset to values over 60. I haven't played with it that much.

From: wb8elk@aol.com
Topic: 4658 Message: 4658

We had a great 21st ARHAB anniversary flight from the middle of the Indiana State Fair....even with very tight spaces to work with, we managed to get it up over the food vendors and?on over the cow barn. We reached 100105 feet.

?My primary APRS transmitter (WB8ELK-11)?stopped right at burst...I suspect either a broken?battery wire or a loose battery.?Fortunately, I had two other?GPS backups....the HF telemetry worked great and got the best results on Hellscreiber and DominoEX5....the DominoEX worked the best of all....I had good copy right down to 4000 feet using nothing but a two meter?whip antenna from 30 miles away on the wrong side of the cow barn....wrong side for signal and wrong side?for?smell.

? I relayed the?HF positions reports to Ron N9QGS and that got him close enough to watch the parachuting payload land?in a soybean field just north of Shelbyville,?IN...not far from Don Miller W9NTP's QTH.

??Ron tracked the 2m beacon and looked for?awhile in waist deep beans...so I resorted to my 3rd backup GPS...the GlobalStar FindMeSpot...and sure enough it was reporting it's actual landing coordinates...he walked right up to it with that data and recovered it all in good shape....beautiful?photos and videos on the cameras by the way.

?Final landing coordinates:? 39d 38.238m? 85d 48.87m

?

Bill,
First APRS packet received here was at 1640 feet. Last was the 100,105 foot one.

What time did the package land? We were copying the two meter beacon until 15:12:20 Z and the 28.172 beacon until 15:17:15 Z.

The ten meter beacon was S7 or greater for most of the flight and Q5 until the very last. Using a 1/2 wave vertical about 20 feet off the ground here on ten.

Topic: 4663 Message: 4664

I just checked with Garmin support and according to them the only limitation above 60,000 ft is dynamics on velocity. All other specifications should be the same as earlier versions of the GPS18. The Tech is going to check with other hardware engineers and get back with me later today. I will post the techs answer when I receive it.

While the colors are quite distored, the clarity of this image is pretty nice. Has anyone looked at what it would take to modify a digital camera to take pictures like this from a balloon?

I just received a response from Garmin that states that the GPS18x is good up to 60km

---
I pulled this information from one of our tech sheets for the gps 18x.

2.4. Dynamic Limits
The unit shall provide navigation information with velocities up to 999 knots, with accelerations up to 3Gs, and
altitudes up to 60km.
So 60km = around 196,000 feet?
Please let me know if you have any other questions---

There is a commercial outfit that will change the filters for you on
certain cameras:

http://www.lifepixel.com/

I've tried swapping out the IR filter on a CMOS camera with a
couple layers of exposed color negative film. It works, but
all my pics have a purple tinge to them.

Hi Mark and all,

We here at NSS did this many times with the CCD video cameras (The B&W ones) that have deep infared responce. By using a Infrared mirror on our rotation mirror system.

It looked just fine in the B&W cameras, In a color camera It would suck terribly!

But in the B&W the increase in contrast was tremendous, and the level of penetration of the "Blue Haze" of the Earth below when at max altitude we have yet to make better views.

Hi Mark,

I think you could apply a near-IR filter to a B&W CCD camera. But the RGB filters on the color CCD camera chip only pass those selected wavelengths, so if any image got thru, it would likely be very, very dark. I think the camera used for that image may have been specially adapted for false color in the IR range.

BTW, I've used a pair of cross-polarized plastic polar sheets to produce a 100 density filter for our B&W up-looking ATV camera - it yields a much nicer image of the sunlit balloon.

W8MAI-11>APOTC1:/231414z4208.92N/08601.59WO037/006/A=050549 11.4V-05C

Reported altitude was frozen from at or before 1343z (no records are available between 1334z and
1343z [?]), until 1410z. During this interval GPS derived time-stamps, latitudes, longitudes,
courses and speeds changed as expected.

It is difficult to explain this -except- by a GPS receiver altitude limit. Perhaps Garmin intended
to continue with longstanding altitude v velocity flight dynamics limits -but- their new coding is
in error (this was a very new GPS18LVC receiver)[?]

Well, I am flying a brand new GPS18xLVC this weekend so I guess we find out if the code freezes the gps. I burned up my GPS18 a couple of weeks when I was getting ready for this flight and had to order the new "X" model. That was the reason I contacted Gramin support yesterday. I had an immediate need to know. Hope you are wrong.

4675. Re: [GPSL] Near-infrared imaging with digital cameras

Yahoo group: GPSL (2002 — 2008)
Date: 2008-08-26 15:20:53 UTC
From: John C Nordlie
Topic: 4665 Message: 4675

Hi Mark.

Yeah, that's pretty steep for the conversion, though the
resulting images do look nice.

My DIY NIR conversion was done on a cheap CMOS-chip camera. I ended
up destroying the lens when I took it apart, but had a webcam lens with
the same thread in my junk box. The overexposed color negative film
makes a visible light blocking filter which is transparent to NIR light.

The webcam optics are different than the original lens, so the images
aren't all that stellar, but if you're interested in some results, I
have some images posted on my website:

http://blizzard.rwic.und.edu/~nordlie/pictures/infrared/

The purple ones are unmodified, the third set I just pulled the images
into a paint program and changed them to greyscale. The focus is
off in the third set as well, the first two are better.

Some indoor shots show plants and algae (in the bottles) to see how
they appear in NIR. These were taken with the camera's built-in
flash, since my CF room lights put out very little NIR. All the
outdoor shots were sans flash.

I have no plans to fly this camera on a balloon, since the camera
itself (Digital Concepts 4 megapixel) is very sensitive to shake
during exposure. I tried it on a model airplane application and
the results were very poor. The NIR conversion in this case was
just a proof-of-concept.

4677. Fw: GPS18LVC altitude freeze at 60kft

Yahoo group: GPSL (2002 — 2008)
Date: 2008-08-27 15:51:05 UTC
From: Ralph Wallio, W0RPK
Topic: 4677 Message: 4677

It appears we need to get past Garmin's product support department with this problem. Anyone who
has internal Garmin contacts please respond here and then bring all this to Garmin's attention at a
level that is prepared to understand the problem.

All previous GPS18 equipped ARHAB flights have been successful above 60kft. This is the first
flight that used a new GPS18x replacement model and altitude froze at 60kft. There appears to be a
software issue that does not meet Garmin specifications.

Here is the unit information from Larry Prelog, KE4PM, with the BARA ARHAB project:

----- Original Message -----

I haven't been able to get any more responses from the OEM support team so I am glad someone else has made better progress. In light of the new information I have swapped out my GPS18xLVC with a GPS15. The GPS15 use 3.3VDC so I ended up using one of my own hitchhiker boards to make a new PCB tonight.

Launch is scheduled for Sunday morning at 6:30AM.

4680. High-altitude volcanic plume over US

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-02 15:33:27 UTC
From: Mark Conner
Topic: 4680 Message: 4680

Thought some of you might be interested in this. The plumes mentioned below are at about 60,000 ft from an Alaskan volcano that erupted last month. It would be interesting to get photos from a balloon around this layer, to see if it's more visible when looking sideways into the layer instead of up/down through it like satellites or ground-based instruments.

Subject: [volcanicclouds] Kasatochi plume still seen over Wisconsin (way up there at 19 km) ??

If this is still the Kasatochi plume, then that beast has
tenacious persistence!

----- begin forwarded message -----

Quick thing of mention that might interest you.

For about a week, there have been 2 aerosol layers at 17
and 19km over the AOS building in Madison. The webpage
thumbnails only go up to 15km, but if you customize the
image to a higher altitude range, you can see the layers.

Ed firmly believes what the HSRL is showing is real, which
reveals low depolarization at a high altitude, with
indications of higher depolarization (5%, but significant)
at the base of it. The idea is that there would have to be
droplets in there with very small particles of ash that
managed to stay aloft, and some traces of sulfuric acid,
which Ed explains is expected to increase with time as the
ash would decrease.

I hope I managed to paraphrase what Ed said.

Here's a link to a 6-hour shot. The 17km layer has faded
some, but the 19km is still sharp.

Anyone have any more info on the GPS 18/18X? Those of you that have the 18X, what's the part number on the unit?

On gpscity.com there is a note under "Garmin OEM18 LVC Part Number Update:" that reads... "This item was formally part number 010-00321-06. When Garmin upgraded the unit to become RoHS compliant, the part number was changed to 010-00321-56"

I see no reference on the Garmin site to the change in part number. I do howerver see a software update/download for v2.70. I wonder if this will work on the 18X?

That note is correct: 010-00321-06 and 010-00321-56 are both a GPS18 LVC, but the -56 is RoHS compliant.

The GPS18x LVC is part number 010-00321-36.

The software for the two models is different. The latest version of software for the GPS18 is 3.20. The latest version of software for the GPS18x is 2.70.

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-06 10:32:10 UTC
From: Barry L. Lankford
Topic: 4673 Message: 4692

Ralph,

Are you asking about the 60kft altitude limit with regard to the GPS18LVC or the GPS18xLVC? I ask because in some other Garmin series, such as the GPSMAP60C and GPSMAP76C, the addition of the lower-case "x" in the model number indicates that the GPSMAP60Cx and GPSMAP76Cx no longer uses Garmin's own GPS engine chip set but uses the SiRF-III chip set instead. The SiRF-III chip set is listed in your own "GPS RECEIVERS vs 60KFT" page as failing the 60kft test (see Holux GR-213, Byonics GPS2 and Notes [1] & [8]).

I can't say for certain that the lower-case "x" in the GPS18xLVC model means the same thing (i.e., that it uses the SiRF-II chip set) as it does in the GPSMAP60Cx and GPSMAP76Cx models, but it sounds very much like a "clue" to me! The "x" models of the GPSMAP60Cx and GPSMAP76Cx exhibit markedly better sensitivity than the older non-"x" models. Perhaps this characteristic is also be evident in the GPS18xLVC as well. That'd be another clue. Unless Garmin confirms one way or the other, clues may be all we'll get.

Interestingly, the GPSMAP60Cx and GPSMAP76Cx models with the SiRF-III chip set allow separate update of the firmwares of both the main (display) processor and the GPS engine processor. If Garmin does indeed supply a firmware update that fixes the GPS18xLVC, I wonder if it'll be firmware that updates the SiRF-III GPS engine. I'm not sure what ramifications that'd have, but it might be interesting to speculate. Maybe other hockey puck GPS of other brands using the SiRF-III chip set may be salvageable for ARHAB use.

Sorry if this is old news. I tried to look through all the posts on this thread and didn't see anything about the possible differences between the GPS18 vs. GPS18x issue. I didn't see anything, so I thought I'd pass this possible explanation on.

Thanks Barry --

Regarding SiRF, it appears -I and -II OEM chip-sets were hard-coded to limit operation to below
60kft but -III chip-set code allows receiver designers to make the decision. We have no reports
of -I or -II based receivers working above 60kft. We have reports for -III based receivers both
working -and- not working above 60kft so display/NMEA processing code differences appear to be in
play.

It is my understanding that GARMIN GPS18x-series receivers are replacing the GPS18-series.

During a quick search I am not finding any information which tells us the new GARMIN GPS18x-series
is based on SiRF-III chip-sets.

Jerome, W0JRT, may have more information.

4694. Filtering Revisited..

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-07 02:22:08 UTC
From: Joe
Topic: 4694 Message: 4694

Hi All,,

Been doing a lot of research, and after learning about the long wave filter and what it takes to remove, (not fun) plus how it really messes up the color balamce.

I was in a Astrophoto group discussing our blue haze problem. And someone mentioned what we really have is a camera that has a deep blue filter in the light path between the camera and the ground.

And in fact quite true.

They suggested we try various different White Balance settings, or if we want to go really radical, and who is flying soon with one of these cameras to test,,

they say it will screw up the pic's while close to the ground but at higher heights it should neutralize the natural blue filter.

how to do it

is it set the camera to do a custom white balance setting.

But instead of setting the camera in front of a white card,,, do it into a deep blue cloudless sky. this should skew the color balance way over and make the blue a non issue,

or so they think..

what's anyone here think?

I'm very interested in doing my first ballooning project. After researching equipment and software, I have come up with a list of payload equipment: Micro-Trak 8000 FA, Garmin GPS 15H-W, Canon A560. For ground tracking: Tiny Track 4, APRSPoint software. Any suggestions?

i recebntly guttred ine if these and my numbers arent anything like
these, this is what i have

On the antenna it has
A16
822

and a barcode sticker says
726 3463980358 52
and hand written in red ink is 5486
any ideas as to what any of this means?

Strongly recommend that you fly a 100% redundant DF beacon in case APRS fails.

You may want a KPC-3 for data reception. The KPC-3 will pick up packets other units like the TinyTrak4 and Tracker2 will miss. When optimized, the TT4/T2 will get 80-90% of the data a KPC-3 will get, but it's that other 10% that might be important to you.

You won't need the latest version for ground tracking - I've seen version 6 KPC-3s on eBay for about $60 or so. Later versions (8.3+) will usually be over $100 (new is about $180).

I agree with Mike. We flew a single transmitter on our last balloon launch and Mr. Murphy hit us with a direct attack; having the only transmitter fail within minutes of the launch was very disappointing. I also agree that a KPC3+ at the ground tracking station gives you much more ability and sensitivity.

I'd also recommend more than one tracking station with several radios involved in the tracking. The more people you can get involved the better.

Thanks for the suggestions. For ground tracking: I'm going with the KPC-3+ (Thanks Mark) and APRSPoint software? Is this the best APRS tracking software? I'm rethinking the payload, is two APRS transmitters a way to go, one on VHF and UHF? Can I run two on VHF? I will try to get some people to help with ground tracking.

We run 2 beacons for the balloon, one on the standard US APRS freq 144.39 and the secondary on 144.70, although any other freq would work too. I tried to pick a local freq that was quiet.

For tracking, I engaged the local ham radio operators of which several had full time APRS receiving stations already operational. So we had 4 ham radio ops receiving the 144.39 signal from launch thru touchdown while 3 temporary ground tracking stations captured the 144.70 signal. With that many ops monitoring, it was nice to be able to in-fill the data gaps and believe me - there always seems to be data gaps.

Others in the group have had radio frequency interference problems with multiple transmitters in a single pod. We fly each transmitter in a separate pod (each with its own GPS).

A DF beacon running 30s on and 30s QRT is easier to hear and track when the payload's on the ground or far enough out that the packets are too weak to decode - a packet burst is too brief to DF accurately. Both can be on VHF, but on different freqs so you can use the same beam to copy the APRS in flight and to DF it on the deck. Of course, if you have trackers in the field at launch, then they could very likely move to a position where they can observe the descent and landing - then the beacons are moot!

4707. BASE 29 - completed

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-12 02:01:08 UTC
From: BASE
Topic: 4707 Message: 4707

BASE 29 was successfully completed today.

Flight summary: Launch at 14:57 UTC Burst at 98 kft
Landing was 55 miles at 98 degrees from launch site on DePauw campus. Landing was just west of Shelbyville, Indiana.

Joined in tracking and recovery by Ron Malinowski (N9QGS).

Landing was in a field that had been flooded in the June '08 event in south central Indiana. The unusable field was covered in weeds that reached ten foot tall. Payloads were located about 150 feet into the tall weeds. I'd rather have been in the corn, at least that is planted in rows.

Additional details will be posted on www.depauw.edu/acad/physics/base

Thanks for your support,
Howard

Blimey, mate! I attended 2nd grade at Milton Road School in Cambridge in 1950 while my dad was stationed at Mildenhall, and where I learned long division in mixed number bases (pounds, shillings and pence). We lived on Asham Rd, just a few blocks from the school. I'm told that I'd developed a rawthah good Queen's English accent there, which vaporized like a summer rain on a Tucson sidewalk when dad transferred to Ft Sam Houston in San Antonio, TX.

See why I talk funny?

It's my understanding that the UK's equivalent to our FAA forbids the use of any non-certified radio transmitters aboard aircraft, not unlike our own prohibition aboard airliners. But the UK applies the same rule to unmanned balloons. So Cambridge may have found a loophole that permits the equivalent of Part 15 xmtrs on 433 MHz. Since that's in the US 70cm band, I say sure, let them have a go at the ARHAB books!

4712. Summer 2009 Super Launches??

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-15 17:13:46 UTC
From: BASE
Topic: 4708 Message: 4712

It's great to hear that GPSL will be in Lawrence next summer. The central location makes it easier for those of us that attend and don't live in the Great Plains.

If we attempt a Field Day Super Launch, that would be on June 27-28.

I've had some discussions with others about the possibility of also having a Great Lakes Super Launch (GLSL) from some location in a state that borders one of the Great Lakes (e.g., Upland, Indiana).

Of course, I'd love to participate in all three events which requires date coordination.

Paul, do you have any idea about a date for GPSL?

Jeff and David, would Taylor be willing to host the GLSL? Would there be a good date to match some of your workshop efforts?

If anyone has a

1. working but old,

2. water soaked,

3. unassembled or partially assembled,

4. or busted non-working TT or OT

that he/she would be willing or even anxious to
get rid of, I'm looking for something of that
description.

With improvements in both vendors's offerings,
I thought there might be a few orphaned or neglected
older ones lying in a drawer out there that might
fill the bill perfectly.

Looking for just the card so that it could be mailed
real easily in a small padded envelope first class.

Hank

Hi Paul,

EOSS already has a flight (actually a 3-fer) on the schedule for that Saturday (the 11th). We□re also on tap for July 25th so that□s makes it hard to go to GPSL on the 18th□families have trouble with ballooning three weeks in a row {:-) . The flights on the 11th are at the end of a Mon-Fri workshop that□s already scheduled with Univ of Colorado faculty and facilities department. So that□s near impossible to reschedule. With some effort we may be able to move the flight on the 25th, but would prefer not to. How about Aug 1st (same weekend as this year)?

4719. Payload tape/connectors for GPS/power connections suggestions

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-16 03:29:39 UTC
From: Ron Malinowski N9QGS
Topic: 4719 Message: 4719

The 11th of July would be a great day, it's my birthday. :-) And I enjoy chasing birthday balloons... :-) I think it would be neat if we could plan a tour of Garmin in Olathe as part of the weekend festivities. Do they have a store there at the headquarters?

On a more serious note... I am nearing completion of a Microtrak 300 with 18LVC garmin, I am going with some suggestions from Bill WB8ELK using pipe insulation. But I don't really have many thoughts on how to finalize the whole thing. I have 3 double AA cases gorilla glued together so they are 2x3 design and that will tie power into the microtrack, and I have an comet SMA24 antenna on the microtrack and okay the way the pipe insulation I got from Lowes works is it has a slit along it to cover over existing pipes. and an adhesive strip to hold it closed and open ends. The equipment fits perfectly in there but I thought of either using tie wraps at different places to keep it closed and the contents inside or tape, and may come in bright colors?

Also I am gonna have to go back in my archive, I was on leave from emails after asking how to get the LED's on the microtrak to stay on so I can monitor power and GPS lock in testing. If anyone cares to touch that topic again, it will help me finish this up this weekend.

Oh and one more, more important, where can I get those small molex connectors that bill uses, I am looking to wire up a reliable connector small in side and that will handle small wires from the GPS 18LVC so I can easily take the GPS out of the circuit and add a pigtail that will go to a computer or my Alinco, etc. 4 conductor is perfect. Radio shack only sells those larger white connectors that are for much larger wires and power amps. I've spent 3 days looking online found pictures cant find where to buy any other suggestions are welcome. I will then solder wires onto the microtrak and put a pigtail on there to adapt to. If anyone has photos of how they did there microtrak connectors you can send me photos at aprsdash9@....

Thanks for everyones help.. Hope to be flying a balloon in the spring... Hope to piggy back my tracker on a flight this fall.

Ron N9QGS

4720. Re: [GPSL] Payload tape/connectors for GPS/power connections suggestions

From: wb8elk@aol.com
Topic: 4719 Message: 4720

Hi Ron,

The connectors I use on most of my payloads are the Molex C-Grid series.....I love them since they are latching connectors. I solder the 5-pin version directly over the DB-9 pins on the Microtrak300 and put the matching connector onto the Garmin GPS18. I use the 2-pin C-Grid for the power input to the Microtrak.

You can get free samples as well as a number of the pins from Molex.

BASE (DePauw) would prefer the August 1 date. August 8 is too late for our summer students and August 15 is too early for our fall courses and after the start of public schools (which was August 14 this year).

Manhattan is also okay with me.

Howard

Cornell has developed a graphene membrane just one C atom thick that holds back 30 psig of He while remaining elastic. Closest thing to the long-sought "Noweightum" for balloon skins that I've heard of.

Not sure if it's economically scalable to the many, many square meters needed for a research balloon, but it's sure worth watching!

Paul,

It looks to me like the NWS capcha codes are not appearing at the moment. This has happened once or twice before, you'll have to wait a while for NWS and try again.

Sorry.

Hi Paul,

GL with the flight, and glad to see you've found a new balloonacy therapy group :=}.

What technique do you use to tie off a 3000 gm neck? We found the neck rubber too stiff to fold over as with a 1200, and ended up developing a an insert made from a PVC to 1/2" NPT reducer held in place with a hose clamp.

4744. GPS18LVC altitude freeze at 60kft

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-26 02:23:11 UTC
From: Ron Malinowski, Jr.
Topic: 4673 Message: 4744

Im sorry I was thrown off by a recent message regarding the GPS 18 LVC, I thought the 18x was the one with the 60kft limit, I just purchased a 18LVC (non X) for a balloon, is there an
issue with a firmware on the older 18LVC? before I fly this unit. It has the latest firmware as
of 1 month ago when I got the unit. Any input is appreciate, would be neat if they could make the 18x with the same limit as the older units, but I'm not sure if that is programmed into the firmware or a feature of the chipset. I noticed all high sensitivity receivers have a
60kft limit that I have researched. and I researched about 17 models in the last 2 weeks especially the little data loggers. We our very honored that Garmin has some units with a little play in them. If anyone know more about this concern or issue I am very interested in
learning more...

Thanks, Ron

I was able to read back a little bit and I understand, and i apologize, but is there for sure a
know firmware in error or a part number change? if its firmware can we load an older firmware back into the newer units. mine was bought about a month or 1 1/2 months back from GPSCity and has not flown yet. I would be happy to fly mine piggyback sooner then later if it helps with any research. I would have to check my part number on the unit I think
its on the bottom. I believe the firmware was recent when I got it. Thanks guys for keeping us updated. I may have my package flown in KY in the next 60 days by Bill WB8ELK, will see if we have all resolved by then.

Thanks, Ron

4748. GPS 18-LVC vs. GPS 18x-LVC

Yahoo group: GPSL (2002 — 2008)
Date: 2008-09-26 13:23:19 UTC
From: w0jrt
Topic: 4673 Message: 4748

There seems to be a lot of confusion about this. Hopefully this message will clear things up. The link that was posted (http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm) does not make it entirely clear as it mixes up the "GPS 18-LVC" and "GPS 18x-LVC", or at least lumps them together. Although they look similar physically they are two completely different models with completely different part numbers running completely different software (although most likely with a lot of shared source.)

The GPS 18-LVC with the 5 meter cable is/was produced under two different part numbers: 010-00321-06 (non-RoHS) and 010-00321-56 (RoHS). They are functionally identical and run the same software. The only difference is that one was built with RoHS-compliant parts and RoHS-compliant processes.

The GPS 18x-LVC with the 5 meter cable has the part number 010-00321-36.

The latest software (006-B0273-00) for the GPS 18-LVC is v3.20 released in October of 2007.

The latest software (006-B0796-00) for the GPS 18-LVC is v2.70 August of 2008.

If you have a GPS 18-LVC there is no problem flying it on a balloon.

If you have a GPS 18x-LVC it currently has a limit near 60k feet. Garmin says this was an oversight and they are working to fix this since it should meet the same limits at the GPS 18-LVC.

-Jerome

Thank you looked like a nice flight for KD4STH watched from burst down. very good APRS coverage through the internet. I will look forward to revised date of W0NSV-11, I learned that their website covering the W0 launch current mission status is an old launch and the information wasn't current so I guess I didn't have a good source for the status :-(hahaha but Im glad I got to another launch in its place. I enjoy monitoring the launch while I work on ham related projects.

Hi Mark,

Those PCBs are probably protection circuits which disconnect the load if either cell gets discharged down to 2.5 or 3.0 V, charged to over 4.2V or if the pack is overloaded or shorted; an over-discharged or over-charged Li-ion cell presents a significant fire hazard, so I'd recommend NOT operating with the PCB.

In that light, can you tell if the cell pairs are wired in series or parallel? It's OK to strap Li-ion cells in parallel with no intervening safety switch, and the pair will operate exactly like a single cell having 2x the mAh capacity of each cell alone, and the safety circuit will be designed to operate accordingly. If they're in series, then the junction between the cells will be brought out to the protection PCB so each cell voltage can be monitored separately.

This means that if you keep the protection PCB with the pack, then you'll have to design your load to operate from either 3.0 - 4.2V or 6.0 - 8.4V, depending on how the cells are strapped.

I got new 18650 cells rated at 2600 mAh for about $8 each, as well as protection circuits for 1S, 2S and 4S configurations and a balancing charger, for all EOSS payloads from All Battery:

http://www.all-battery.com/index.asp

So your $3 / pair price is a bargain, but then again, the mAh capacity is only about 1/2 that of the new cells. If an application requires voltages other than what Mark's protected packs are designed for, consider replacing the PCB with one designed for the desired pack voltage and break out the single cells to roll your own.

That site also has adjustable switching buck regulators configured to plug into a uA750x linear regulator socket; I'm using a couple of those with a 4S pack of 18650's to provide regulated +12 for the PCE KPA-5 ATV xmtr and +9 for one of the cameras and a bulk supply for the several 5V linear regulators. EOSS-132, flying this weekend, is 100% Li-ion powered, except for the backup release burner and the B-LAN module.

Yup - I meant DON'T run 'em w/o the PCBs. Stuff happens when ya edit yer
own drivel :={.

OK on the 2S (2 in series) configuration. I'm using a 2S-2P config in
AE0SS-11 yielding 7.4 @ 5200 mAh to ensure over 24 h battery life in the
rare event of a long recovery. I think you can probably strap two
of your packs in parallel at the load terminals to double battery life.
I think this is what Larry K0ANI did on his APRS/DF/Cutter beacon after
it died during descent on early flights; he's using COTS hobby shop
Li-ion packs, and it works well.

I have used similar cell phone battery cells in a three cell (12v) serial configuration using a Li-ion quick charger to charge the pack. Use of a charge/discharge circuit is absolutely necessary with Li-ion batteries. The chips on the PCB that came with these single cell packs were easily identified and with a little work, I was able to modify one of the PCB boards so that I could control the charge and discharge of the first battery in the series. While this arrangement does not insure an even charge/discharge across the remain two cells, it does provide a level of protection I am comfortable with. My guess is that the Qualcomm PCB on these batteries are a two cell charge control circuit. If your happy with 7.2 V leave it in place and figure out where to connect the charger.

A member of my local radio club has designed a Maxim based, surface mount, three cell charge control circuit, complete with circuit board. The intent of this circuit is to replace NiCad or NiMH batteries used on handheld VHF radios, with a 12v Li-ion pack. If you need a 12V Li-ion (or Li-poly) battery for an ARHAB projects, this is the circuit for you. Using surface mount components is not for the faint of heart (or poor of sight), but if anyone is interested in the details, please drop me a line.

The nice thing about Li-ion, besides their resistance to cold, is that once charged, they have a very nice shelf life. At $1.50/cell, this is a great deal.

Hi Kent,

I see no reason why 2 or 3 of those 2-cell packs couldn't be operated in series with the original PCBs left intact. I have noticed that one can't assume that each cell will discharge identically with others in the series string, so depending on just one cell's voltage to infer that of the other's leaves one open to a nasty surprise.

The PCBs don't equalize discharge - they just trip out the whole pack when any one cell drops below the preset minimum voltage. Nor so the ones I have equalize charge - they just trip the whole pack if any one cell exceeds the preset max voltage.

And although $1.50 per cell is indeed a bargain, $8 / cell spread over 500 recharge cycles is WAY cheaper than even alkalines! NiCd and NiMH can be used in payloads, of course, but special care must be taken to keep 'em warm. The best chemistry for temps down to -40C is LiSO2, but that's the high-priced spread now that the surplus stock is gone. Li-ion is rated down to -20C, so I thermally couple mine to power-hog loads or use a thermostatically-controlled Minco heater set for -15C.

You should get 2 hours 19 minutes @ 1280 x 720 Pixels (H.264) up to 30 fps with a 4Gb SD card according to my HD recorder.

To: gpsl@yahoogroups.comFrom: nearsys@...: Sat, 4 Oct 2008 13:58:24 -0600Subject: [GPSL] Video Camera

I found the Jazz website. The camera is the HDV-178 and allows up to a 4 Gb SD card. By my calculations, that should allow two hours of video. I got about 33 minutes with a 1 Gb card.-- Onwards and Upwards,Paul

4766. There's Always Hope For Balloon Recovery

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-05 18:50:45 UTC
From: Dan Wietchy
Topic: 4757 Message: 4766

Hunting Guide locates the lost BEAR 2 balloon.

The BEAR 2 balloon, launched on July
29th in conjunction with the special event station W1AW/KL7 was lost due to suspected
MicroTrak/GPS transmitter antenna damage. This was the balloon that contained both
an APRS beacon and packet (digipeater) system which allowed amateur radio
operators from across the state to communicate with each other for the ARRL special
event. Due to the high wind speed in the
middle of the Alaskan summer, we originally designed the balloon to have only
one GPS beacon, realizing the balloon would rapidly travel out of our immediate
area and probably be non-recoverable.
Despite this fact, we still hoped to be able to track its flight. Although the packet
system remained functional
for over 3 ½ hours while in flight, with the failure of the beacon antenna, there
was no way to receive APRS position reports and we presumed the balloon would
be permanently lost.

On Sunday September 28, big game
hunter Jared Owens was guiding a hunting party client (Ron Rockstad) in the extremely
remote area of the West Fork of the Little Delta River (Healy D1 quadrangle)
when he spotted something blue and yellow on top of a nearby peak. Being curious, he hiked
up to the location and
noted the BEAR 2 parachute and payload capsules. Fortunately, all the capsules
had ownership and phone numbers written on the outside so Jared called Jerry
(KL7EDK), and Dan (KL1JP) on his satellite phone informing us about his find.
After returning to Fairbanks
several days later, Jared met with us to return the balloon remnants which were in
excellent condition.

It was an absolute delight to be
able to successfully retrieve the BEAR 2 flight data after 2 months of
wondering where it was. We now can confirm the
balloon reached an altitude of 92,341 feet, traveling 112 miles from the
launch point.

More flight data and pictures are on
the BEAR website (http://www.bear.437am.com)

NEVER give up hope of a lost flight package !

Dan (KL1JP)

Topic: 4764 Message: 4770

If you haven't purchased an HD video recorder you might want to take a look at DXG DXG-569V 5.0MP Digital Camcorder (http://www.radioshack.com/family/index.jsp?categoryId=2032121&cp=2032055&allCount=52&fbc=1&f=Brand%2F1000261%2F&fbn=Brand%2FDXG). It runs the same price as the Jazz and uses 3xAAA batteries of your choice. I have had very good results from their line of digital video recorders.

I used their standard definition model for all my previous flights and the videos came out really nice. Planning to pick one up in the next couple of days. Not sure if it has external AC port but should not be any issue powering it with external batteries for extended life. Two leads coming out of the battery compartment connected to a regulated power source should do it.

Anyway ... just another choice to consider if you are looking for a cheap HD video camera for your balloons

To: GPSL@yahoogroups.comFrom: mconner1@...: Mon, 6 Oct 2008 09:18:44 -0500Subject: Re: [GPSL] Video Camera

Does the unit have an AC adapter that it can get power from? A couple minutes on Google yielded some indication that it can. You might be able to overcome the battery life limit with that using an external battery and get another ~15 min of record time.
I'm hoping to have a camera that will give launch-to-landing video - most of my flights are right about 2 hrs. This is looking pretty good.

For still images the HDV178 can go up to 11 megs but video is the same for both units if I am not mistaken.

I'll need to recheck, but I believe the Jazz is 11 MP.Paul
On Mon, Oct 6, 2008 at 10:17 AM, Earl Foster <ebf306@...> wrote:

If you haven't purchased an HD video recorder you might want to take a look at DXG DXG-569V 5.0MP Digital Camcorder (http://www.radioshack.com/family/index.jsp?categoryId=2032121&cp=2032055&allCount=52&fbc=1&f=Brand%2F1000261%2F&fbn=Brand%2FDXG). It runs the same price as the Jazz and uses 3xAAA batteries of your choice. I have had very good results from their line of digital video recorders. I used their standard definition model for all my previous flights and the videos came out really nice. Planning to pick one up in the next couple of days. Not sure if it has external AC port but should not be any issue powering it with external batteries for extended life. Two leads coming out of the battery compartment connected to a regulated power source should do it. Anyway ... just another choice to consider if you are looking for a cheap HD video camera for your balloons

I would be very careful with this circuit design. It is a CC/CV regulator, but it doesn't have any of the other safety features required in a Li-Ion charger. These include a charge expiration timer, slope detector to determine when stop charging, bad cell detection, etc. TI and Maxim make single chip chargers with all the required safety stuff.

If the cells are mistreated they will burn. Just search on You Tube for Lithium Ion battery fires. I'm waiting for the first Prius to burn in someone's garage with a 1200 degree fire when the Chi-Com cells short out.

At least charge them on the garage floor with plenty of defensible space.

Do you have any chips you recommend in DIP packaging? All the ones I've found so far will only handle single-cell configurations. It'd be nice to get something that would handle up to 3.

I know a lot more choices are to be had in SMDs but most of us aren't quite able to go that route.

I knew that was the next question. I looked after I sent out the
e-mail, but everything is surface mount. Although some are quad flat
pack or leaded devices. So even though they are surface mount, you can
hand solder them.

Another option is to purchase an evaluation kit. TI sells them for $49.

http://focus.ti.com/docs/toolsw/folders/print/bq24012evm.html

If you have 1 to N cells, what about charging a single cell at at time?
If you are going to put them in sockets, it wouldn't be hard, other
than requiring longer, to charge them one at a time. For a balloon
effort, requiring 12 hours to charge batteries isn't an unreasonable burden.

An n-cell balancing charger will endeavor to equalize the charge on each cell in a series pack. Considering the long-term economy of using Li-ion vs primary cells, the purchase of a full-up COTS balancing charger should be easy to justify.

Hi Mark,

On EOSS-132 flown last weekend, we replaced the 11 LiSO2 cells those payloads used to consume with Li-ion. At last buy, those primary cells would have cost us $22. The 1 to 4 cell balancing charger from All Battery cost $75 - and is expected to support 500 such flights before the Li-ions need replacement.

You run the numbers. And that doesn't take into account the effort to replace and dispose of the used primary cells.

EOSS is a non-profit, so we don't amortize such assets; they're booked at cost for their useful life.

Why re-invent the wheel? You might want to look at some of the chargers and balancers that are already available in the hobby shops. I have an IntelliPeak ICE that I've used for a couple years and it does almost every kind and configuration of battery out there.

Here is document on modifiying the Nikon Coolpix L series. The Nikon Coolpix L15, only available on ebay now, has optical image stabilization whereas the newer Coolpix use digital imaga stabilization.

http://www.hapb.net/HAPB3_files/CameraMods.htm

To: gpsl@yahoogroups.comFrom: nearsys@gmail.comDate: Fri, 10 Oct 2008 08:58:02 -0500Subject: [GPSL] Camera Mod

Here's a picture I took of the Digital Concepts camera I modified. When I shrank the image, it goofed up the text (I don't spell that badly). I've pointed out the four pads on the little PCB on top of the camera. You only need to solder to the shutter pad and ground. I didn't get the on/off pad to work correctly (I can shut off the camera, but I can't turn it on). I may try soldering to the four wire someday and see if that will switch it on.-- Onwards and Upwards,Paul

Caught on powerlines, fire in the basket. This is the worst case scenario for hot air ballooning. I helped Keith inflate and launch on Saturday, sounds like he's in tough condition now and the other occupant of the balloon basket didn't make it.

- Mark

4792. Keith Sproul WU2Z of WinAPRS in critical condition after balloon crash

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-10 22:35:38 UTC
From: wb8elk@aol.com
Topic: 4792 Message: 4792

I looked at the footage of the terrible hot-air balloon crash in Albuquerque, NM and immediately recognized it as Keith Sproul's homebuilt tetroon. I last saw him at the Dayton Hamvention where he showed me photos of this unique hot-air balloon. Keith WU2Z and Mark Sproul KB2ICI are the co-authors of WinAPRS and MacAPRS.

According to the news reports I can find, he is in critical condition after having fallen from his balloon gondola after hitting power lines. Another person in the gondola did not survive the accident.

Anyone having more info on his condition, please forward to the lists.

- Bill WB8ELK

Oh My Gosh!

Any more details Bill?

I haven't talked to Keith or Mark in geez,,15+ years? They were brought
to me, way back when in our early ballooning days.
A guy in Illinois KA9NHL Dave Chesser Worked with them on our first
balloon payload that had APRS onboard. They even were here at the
launch, This was when it was still all Mac stuff, I had no capability
to run Mac stuff but Dave NHL did.

I remember them having a blast during the flight. I still have the GPS
unit that we used that day, So funny how the technology has changed I
have a gps on my desk that is maybe 1.5" square and 1/4' thick

This one we flew with the brothers, was a assembly of two PC boards
stacked with spacer standoffs. both boards were totally populated. and
get this,, it is 4" wide by 10" long!

wow huh?

4794. Re: [Balloonatics] Keith Sproul WU2Z of WinAPRS in critical condition after ball

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-11 03:37:48 UTC
From: Ron Malinowski, Jr.
Topic: 4792 Message: 4794

It was Keith Sprouls balloon. Keith is in ICU with severe burns. It was a crew person that lost
his life this morning. My thoughts and prayers go out to both families, and to Keith.

4795. Fw: Tetrahedron balloon crash at AIBF

Yahoo group: GPSL (2002 — 2008)

From: Joe Lynch
Topic: 4795 Message: 4795

Dear Bill, et. al,

According to this KOB story (see link below):

"Sproul, a pilot with 10 years flying experience, was airlifted to University of New Mexico Hospital with serious injuries including a broken leg, broken hip, punctured lungs and burns to the face.

"He underwent surgery Friday afternoon. Sproul's brother said the injured pilot's condition has been upgraded.

"'The good news, he's been upgraded from critical to serious, he's got burns to the face, a broken femur, a broken hip, and punctured lungs.'"

http://kob.com/article/stories/S613785.shtml?cat=516

I add my thoughts and prayers for Keith's recovery and for his family, as well as for the family of Stephen Lachendro.

My thanks go to Harry Mueller for forwarding the above link.

Sincerely,

Joe Lynch, N6CL

4796. Aircraft ID on APRS network?

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-11 17:32:37 UTC
From: Ron Malinowski, Jr.
Topic: 4796 Message: 4796

I have a quick question cause I have seen aircrafts appearing on the APRS network, and I think its great to watch, but they are not using an amateur call sign, they are using there FAA
plane ID as there callsign on the APRS transmission. I question if this is legal cause if you are
transmission over APRS in the ham band, then I would think you would have to use your amateur call sign, and maybe put your aircraft ID in a comment text, etc. Could anyone comment.

Thanks, Ron

4800. High Altitude Balloon Launch @ North Star District Camporee & JOTA

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-12 22:42:22 UTC
From: Keith Kaiser
Topic: 4800 Message: 4800

Near Space Ventures will launch a 1500g, Hydrogen filled High Altitude Balloon on Sunday, October 19th, at aproxamatley 8:30a.m. Central time as part of the North Star District BSA Camporee & Jamboree On The Air (JOTA) 2009 event.

Launch Site:
Smithville Lake, MO @ 39.41585N -094.50503W

Onboard APRS on 144.390Mhz,

Call Sign: WØNSV-11

You can follow the balloons location, altitude and speed from the Internet by clicking on; http://aprs.fi/?call=w0nsv-11 after launch on the day of the flight.

Simplex Repeater: 147.555Mhz/100PL --> The tone is critical to keep the repeater out of APRS

See http://bsaroundtable.org/wa0tjt.html for more information, or contact Keith at kcscouter@...

We will also have at least two HF stations operating during the JOTA weekend, including examples of digital (PSK31, Hellschreiber, etc), VHF/UHF, satellite and slow scan TV. Join us in person, online or on the air for a great weekend of Ham Radio.

Look for us on all the;

World Scout Frequencies found at http://bsaroundtable.org/wa0tjt.html

Hi Paul,

Any TTL or CMOS xtal oscillator running at a subharmonic of the desired
2m freq can be used for this app. But it can only be modulated in CW
by switching 5V (or 3V) power on an off. Just connect a half-wave dipole to
the output and gnd pins. Mouser, Jameco and DigiKey all carry a variety
of off-shelf freqs. Just avoid the ones commonly used in computers and
video monitors if you plan on using one for a DF beacon - did that once
and almost lost the flight, since the sig was wiped out by QRM in every
town we ran thru! IIRC, it ran somewhere in the 27 MHz range and is used
in many SVGA monitors.

Paul,

Any of the clock oscillators will work...but the ones in metal cans are the ones I've used before with good results....I use the ones on 10 meters and they put out about 50 milliwatts on the fundamental frequency....the 2 meter harmonic is about 2 milliwatts. Typically the cheap ones that are readily available are on 29.491 MHz which gives you a 2 meter output on 147.455 MHz. If you feed this into a 2 meter antenna, it'll work decent enough for copy from a balloon. Some of the ones from Digikey will allow you to customize your frequency when ordered (they program them on the spot at Digikey) but be aware that I've found some of these that seem to have lots of phase noise when used in this manner.

For custom frequencies, the ones I've used quite successfully are from Cal Crystal Labs and cost about $11 (3 week lead time though)...more expensive if you need them quicker. That way you can choose your own frequency. I prefer to use 48 MHz for this since the 3rd harmonic on 2 meters is fairly strong.

By the way, it is possible to directly AM modulate a clock oscillator module...I published a circuit in Radio Fun magazine about 18 years ago and it's very high fidelity audio. I use that circuit on 10 meters and have flown it successfully many times. I'll try to scan in the schematic for you. They are also great for CW. I had one on the very first flight from the group that went on to found EOSS that I could copy 1500 miles away in New Hampshire while it sat on the ground in Colorado. Of course, that was at the peak of the solar cycle and you could practically shout out the window and have it bounce off the ionosphere back then. Bob Moody K7IRK worked all states using one of these clock oscillators by itself hooked directly to his 10 meter beam. It's called the Fireball....I published that article in the July 1990 issue of 73 magazine.

Well, yeah - the thru-hole versions typically fit in a 14-pin DIP socket, pins 1,7,8 and 14. But it's not just a crystal (some xtals are supplied in that package) but a complete xtal oscillator with CMOS or TTL output drive levels. There are also smaller ones that fit in an 8-DIP pattern as well even smaller SMT versions.

LiPO and Li-ion are basically the same chemistry and thus take the same charge profile. However, LiPO doesn't tolerate low temps - the polymer electrolyte begins to freeze up not much below zero C. LiPO advantage is its thin profile, so one may be able to keep cells warm by taping them to payload heat sources e.g. radios, GPSs, etc.

4817. BASE 30 - Successfully completed

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-16 19:45:50 UTC
From: BASE
Topic: 4817 Message: 4817

Dear all,

BASE 30 was successfully completed today. Launch at 10:15 UTC from the Julian Center roof on our campus. Four 1 W Red LEDs and two Lightman Xenon Strobes made for a pretty ascent. I will be posting pictures and video in the coming days.

Maximum altitude of 95,000 feet. Landing 100 miles from launch site at a heading of 80 degrees.

Recovery was in a soybean field that had been harvested on Tuesday. It was almost too easy.

FYI, the Garmin 18 that was exposed to the night sky froze at about 64,000 feet when the external temperature had stabilized at 250 Kelvin. That unit awoke from its suspended animation about 10 minutes before landing.

A similar Garmin 18 for the APRS unit was shielded under a 5 cm thick foam board lid and operated throughout the flight, although part of the descent was only 2-D information.

Our next flight (BASE 31) will be on November 20, and I hope to have a working float valve for that effort.

Additional information will be on the website:

www.depauw.edu/acad/physics/base

Take care,
Howard

Interesting low-altitude balloonish thingy. Note that it's basically
a super-pressure envelope, so it operates a pretty much a fixed
pressure altitude. It's also a UAV, and as such, it must stay
under 700 ft AGL like an R/C model to avoid the FAA's draconian
UAV rules.

Flying Sensor's partnership with Hyperblimp allows them to provide a
highly efficient and patented airship design capable of autonomous as
well as remote controlled flight. The Hyperblimp is an
ultra-streamlined, low drag, helium-filled airship that slips through
the air, rather than pushing it aside. It is propelled by a central axis
rear propeller, capable of moving in any direction. The airship utilizes
brushless motors and lithium polymer batteries, and can achieve very

long flight times through the use of solar power or fuel cells. This system can be equipped with a full suite of sensors and cameras. The Hyperblimp also makes an excellent aerial photography and aerial video platform. The Hyperblimp is lightweight, portable, and deployable in nearly any environment.

4819. Re: [GPSL] Lithium Ion Charger

Yahoo group: GPSL (2002 — 2008)
Date: 2008-10-23 04:32:06 UTC
From: Mike Manes
Topic: 4773 Message: 4819

Hi Mark,

No, the one I got was in a grey case and cost just $75, otherwise it looks
the same.

BTW, I did post a review of the one I got, griping about the
Chinklish user manual and its lack of detail about some apparent "undocumented
features", e.g., differing behavior between short and long pushes of the
start/stop button. Another user wrote back, complaining about the one
shown in your link, the white one, saying it didn't balance and terminated
charge well before the cells hit 4.20v. So in that light and the much
greater price of All Battery's current offering, I'd recommend looking
elsewhere.

I'm quite happy with the performance of my "grey" version, however.

4820. Rechargeable Batteries & Battery Chargers - Universal Smart TLP2000 Charger for Li-Ion/Polymer battery Pack (3.7V - 14.8V, 1-4 cells) with 2-6 Cell Lipo Pack Balancer

Yahoo group: GPSL (2002 — 2008)

From: Mike Manes
Topic: 4820 Message: 4820

Ref my recent post re the All Battery Li-ion charger/balancer:
All-battery offers a 2-piece charger and balancer for $53 which, per specs,
should do a pretty good job on 1 thru 4 cell series packs, altho it's
limited to 500 mA, so a full charge may take a long time. But who flies
that often, anyway?

I live in NE Iowa and this was today's newspaper headline story:
http://wcfcourier.com/articles/2008/11/12/news/local/doc491ad361def8d628366385.txt

I know some of the folks on this list were friends with the victims of
this crash. I don't mean to stir up anything here. I simply want to
share the local coverage to this incident.

Pete

4824. BASE31 - 20 November

Yahoo group: GPSL (2002 — 2008)
Date: 2008-11-17 23:31:41 UTC
From: BASE
Topic: 4824 Message: 4824

Dear friends,

We've had to make a few adjustments to our flight plans for Thursday's flight.

Launch will be at 17:00 UT (12:00 Eastern time) from the North Montgomery School Corporation (40.12 N,-86.91 W).

Ascent at 1500 feet/min. Burst at 95,000 feet.

Landing at 18:40 UT near Cambridge City, IN (39.79 N,-85.23 W).

Great circle distance of 92 miles!

In addition to the student science payloads (cameras,dual axis geiger counters,and tilt sensor), flown in a spin reducing configuration, we will be flight testing a new radio and GPS built by Ron Malinowski. Ron's radio is the MicroTrak 300 and the GPS is the Garmin 18x with the revised firmware. Ron's radio will use his call sign N9QGS-11. Hopefully it will work above 60 kft.

Our plan calls for W9YJ-11 to beacon near the even minute and N9QGS-11 to transmit on the odd minute. We will also fly the 900 MHz spread spectrum radio.

The corn and beans are almost all in the barn. Looks like we'll have to find a tree:)

I'll report back post-flight.

Howard

4825. BASE31 - almost complete

Yahoo group: GPSL (2002 — 2008)
Date: 2008-11-21 03:47:37 UTC
From: BASE
Topic: 4825 Message: 4825

Dear friends,

BASE 31 was an exciting flight. The balloon fill under 25-30 mph winds and air temperatures of 34 degrees Fahrenheit kept our heart pumping even if our hands were cold. Liftoff at 17:54 UTC. Jetstream speeds exceed 145 mph! Maximum altitude of 85000 feet. Burst occurred at 19:17 UTC. Landing happened just before 20:00 UTC in the median of I-70 just west of EXIT 14 near Lewisburg,Ohio. Ron,N9QGS, picked up the payloads that had been spotted by another amateur radio operator. (Will post the photo later.)

When the BASE recovery vehicle met Ron in Richmond,IN, we confirmed the reason for no signal from W9YJ-11. All that was attached to the payload strings were the carbon fiber tubes that formerly went through the foam enclosure. Reviewing the APRS data led us to Greens Fork, IN (near to landing of BASE 30). We patrolled the area, but did not hear a signal (the radio impacted at 50 mph). As we were departing the area, we did receive a signal. The GPS data was only 2-D, and the exact location shifted by a few hundred yards as we walked through harvested corn fields. I'll return tomorrow to search in the daylight.

Most importantly, the Garmin 18X in Ron's N9QGS-11,worked perfectly in the ascent phase to 85,000 feet. The system did not get a good GPS lock for the first 16 minutes of descent, but performed flawlessly for the remainder of the flight.

More information to follow on www.depauw.edu/acad/physics/base

Thanks for your support,
Howard

4826. BASE 31

Yahoo group: GPSL (2002 — 2008)
Date: 2008-11-21 07:19:11 UTC
From: Ron Malinowski, Jr.
Topic: 4826 Message: 4826

Howard summarized the excitement of todays balloon launch. Hope howard can fidn the missing package :-) We lost daylight too quickly and it was snowing. But I have a question for the general group I got input from Howard, as you know we were testing the GPS 18x for the 60K issue, we did get above this without any problems, but we did get a lockup on data updating and altitude/sped/heading reporting zero. this was after burst, I know we had some high winds and were moving over 120 mph at times. but trying to get an understanding what possibly made it lock on decent, question if there is still a concern with the new firmware, or were we meeting some other criteria that could cause this? anyone have a list of the criteria that puts it in this mode? I dont believe the GPS can loose lock, but also the W9YJ-11 that free fell is still beaconing but its reporting all zeros
for altitude, which again I question what i causing that, so Im hoping to hear some knowledge.

Dear Mike,

The foam core box was manufactured by StratoStar. I have flown several of their boxes including our primary 900 MHz spread spectrum flight computer. This is the first failure of the tubing pulling that I have had. We have flown approximately 70 boxes with the configuration, plus another 70 of our own construction with different tubes (typically nylon).

Jeff Dailey would be able to confirm this, but I believe that all of the tubes were secured with 2 hour epoxy.

Howard

Since it seems your GPS payload broke free from the flight string shortly
after burst, then it most likely tumbled such that the GPS antenna never
got a long enough view of enough of the constellation to establish a solid
fix. And it's entirely possible that it accelerated past Mach 1.0 in the
thin air at altitude, which would have invoked the anti-Scud rule. Further,
the process of tearing free may have damaged or disconnected the GPS antenna.

The problem thus appears more likely to be payload enclosure robustness than
a GPS performance issue.

Mike,

Just to clarify, Ron's unit, N9QGS-11, stayed in the flight string. Our unit, W9YJ-11, was flying lower on the string and was the only one to fall freely.

Howard

4830. W9YJ-11 recovered BASE31 completed

Yahoo group: GPSL (2002 — 2008)
Date: 2008-11-22 01:32:47 UTC
From: BASE
Topic: 4830 Message: 4830
Attachments: 1 described; binary payloads are missing from this source WARC

We returned to the vicinity of the last signal from the W9YJ-11 pod this afternoon and retrieved the pod in 10 minutes. The final landing spot was 200 yards to the east of the last GPS value. Landed in a plowed corn field GPS side down.

I'm attaching a .jpg from Google Earth that shows the two landing points. The landings occurred 28 miles apart.

Next BASE flight will be 10 January 2009. A new class of students will make flights on consecutive Saturdays (10th and 17th) in January. Considering the anticipated winds, we can use all additional trackers.

All for now,
Howard

ASTRO-11

Post-Flight Summary

http://astro.okstate.edu/ASTRO_11/ASTRO-11%20Post%20Flight.htm

ASTRO-11 was launched at approximately 9:04 (15:04Z) on Nov. 11, 2008. Students from all of the ENGR 1111 Intro to Aerospace Engineering teams were present to assist with the launch. OSU President Hargis was also present to talk with the students and witness the launch. Photos of the launch and recovery can be found below.

The track of ASTRO-11 was close to that predicted. The descent phase was shorter due to the fact that the balloon remnant did not separate from the load line after burst. The added weight increases the descent rate. The landing location was in a forested area near Leonard Oklahoma. The satellites were recovered in a tree on USGS land (see link below).

Peak Altitude: 97,917 ft.

Top Speed: 149 mph

Straight-line distance: 73.5 miles

Satellite view of landing location

Recovery Team:

Joe Conner OSU PhD Student, Mechanical and Aerospace Engineering

Ryan Paul OSU Junior Mechanical and Aerospace Engineering

Johnny Chandler OSU Junior Mechanical and Aerospace Engineering

Ralph,

Post my prediction if you choose, but due to erronious
data provided to me to make the landing prediction it
was way off. I'll probly not try to predict any more
OSU flights. I am rarely at launch and they have a habit
of not providing me with good predicted ascent/descent
data. Therefore I cannot make accurate landing predictions.
If ASTRO-11's ascent would have been as they provided me
for predicting the prediction would've been closer.

Hi Harry,
Perhaps Rick can help with these. The ascent and decent rate should be a function of the balloon fill and knowing what the weights are. EOSS shoots for around 1000 ft/min and usually gets it. I've already said more than I know. Perhaps Larry and Rick can provide some insight. You are as experienced at this as we are. Do your customers not provide weights to you? If not, that is going to throw a lot of stuff off.

Larry? Rick?

Hey Marty,

This flight was an OSU flight and I was not at the launch. I have an idea what they plan for lift, but that is subject to change without me knowing until I start getting positions on the way to my predicted landing area. The problem is the proposed ascent rate I receive pre-flight. This past flight I was told the ascent would be 1400 fpm, that's what I based my prediction on, but they just dumped two full tanks in and it ended up to be 1600-1800 fpm thus the landing was much shorter than predicted pre-flight. Too late to send Ralph an update when I'm down range.

I just don't want to skew Ralph's list of "Touchdown Prediction" list that's all.

Thanks!

4839. Re: [Balloon_Sked] achived height vs balloon type and filling

Yahoo group: GPSL (2002 — 2008)
Date: 2008-11-27 00:15:03 UTC
From: Mike Manes
Topic: 4839 Message: 4839

Hello Thomas,

HEre's a link to all of EOSS's balloon-related software:

http://www.eoss.org/balsoft.htm

LiftWin is quite handy for computing a fill for a variety of balloons based on the weight suspended from the balloon neck. Both He and H2 are supported. As a rule of thumb, one should aim for about 1000 ft/min ascent rate to avoid stalling when flow separation occurs at high altitude.

A latex balloon can "stall" either due to an inadequate fill, cooling after sunset or a gas leak. It's an excellent idea to include a commandable release device to bring the payload string down before it soars out of sight and its batteries die.

It's also possible to get a substandard fill if there is over about 10 kt wind over the balloon during the fill; this creates "false lift" due to the top of the balloon acting like an airfoil. Best plan is to avoid filling under such conditions; winds are typically calmest shortly after sunrise.

And yes, the long-duration fligths typically use "zero-pressure" plastic balloons which have vents at the bottom. But it's also possible to cause a latex balloon to float at some desired altitude by controlling a dump valve in the neck. Another scheme is the super-pressure balloon which has a fixed, sealed volume - but it must withstand the excessive pressure of the fill gas during the day.

Hi

Now that winter is upon us it's time to design equipment for next year's flights. Currently I'm flying a Garmin GPS18 connected to an OpenTracker1 and an SRB MX146 radio. I also have a SparkFun electronics logomatic to log the GPS data. This is all powered by 4 CR123 lithium cells. I want to redesign my tracker for next year. The objective is to make it smaller, lighter and consume less power if possible. I've already settled on reusing my MX146 radio and will switch to the OpenTracker SMT. I' may also switch to rechargeable lithium polymer cells. So, that leaves me with the choice of what to do for a GPS.

I started out planning to use a Copernicus module. I soon found that working with the small connections was a bit more difficult that I had hoped. Although it's very light it still needs an antenna and circuit board so the weight decrease was less than I had hoped for. I've also been told that it really needs an active antenna for best performance so this further decreased my weight savings. The additional power needed for the active antenna also reduced my power savings. The last straw was when I learned that my Copernicus module is probably defective.

I'm now back at square 1. One option I'm considering is the Larsen IQ module or the Garmin GPS15 module, but both still need an active antenna. Another option is to disassemble my GPS18 and just use the module. This is will help with the weight but not the power consumption.

So, what are other people using? What experience have you had integrating GPS modules into your flight packages? Any suggestions of what I should look at or avoid, besides the obvious one of working above 60,000 feet?

Thanks

Bruce - VE5BNC

Hi Bruce,

<shameless plug>

I use the Lassen IQ in my BeeLine GPS product (which is a completely integrated 2 meter 5 watt GPS/radio/APRS transmitter). It's been proven to work above 18000 meters, and is very low power.

http://bigredbee.com/blgps_2mhp.htm

</shameless plug>

I can provide a breakout board with on-board voltage regulator for cheap if you're interested in playing with the Lassen. I just take the BeeLine transmitter board and leave off the PIC and the radio circuit. You're left with a power connector and connectors for the two data ports on the lassen.

I can also provide the Lassen / Antenna if you're interested for a few $$$'s cheaper than what you can get it for at SparkFun.

Hi Thomas,

Apologies on behalf of us Yanks for desperately clinging to the English system, ironically abandoned long ago by the Brits. I expect that sometime in this millenium, we'll join the rest of the civilized world in fully adopting the metric system, perhaps even before the only other hanger-on, Liberia!

By "stalling", I mean a significant loss of ascent rate to the extent that burst and descent may be delayed until the flight is much farther downrange than planned.

I pointed out the most effective measures to avoid stalling, but I must emphasize the importance of carrying a commandable cutdown device if all else fails. This device has been used even on otherwise normal flight to avoid landing in an unaccessible area. The EOSS cutdown device also incorporates a DF beacon - it transmits a DF signal for 30 sec every minute, and listens for a DTMF cutdown command for the remaining 30 sec. The DF beacon has paid for itself many times where the APRS beacon has failed - most recently on our last flight.

IF you have run LiftWin, you may have noticed that for a given balloon and payload weight, one may fill for a range of ascent rates. A more generous fill will yield a faster ascent rate due to greater lift, and will result in burst at a lower altitude due to the greater volume of fill gas; the envelope will burst at a fairly predictable expanded maximum diameter.

EOSS has achieved its 100% recovery rate largely because we deploy the tracking and recovery teams out to the vicinity of predicted landing before we even start the fill. This has allowed the teams to witness the descent and landing on nearly all flight in recent years. During the summer, the upper winds are easterly, which causes the balloon to return towards the launch site, sometimes even passing directly overhead. On those flights, the trackers typically will deploy from the launch site after assisting the launch team. Winter flights, however, can be expected to travel at least 100 km downrange.

I'm not aware of any amateur balloon group who have successfully flown a latex release valve, but a company in New Mexico, US, Space Data, uses that method to float mobile phone cell sites in the stratosphere for up to 3 days.

Both latex and plastic balloon envelopes must be as light as possible, and thus rarely survive a flight and landing intact. And latex deteriorates rapidly in solar UV radiation - and often to the extent that a lightly-filled and slow-ascending balloon may burst at a lower altitude than a faster one, contrary to the assumption of a fixed burst diameter noted above. Accordingly, re-use of balloons is hardly worth a second thought.

In the US, Kaymont Inc in New York distributes the Japanese Kaysam line of latex balloons. A 1200 gm balloon, suitable for flights under 5 kg, costs about US$65.00 plus shipping. You might check with some of the other EU balloon groups listed on Ralph Wallio's web site for their sources. Beware of bargain basement latex balloons which may not have been stored properly or have exceeded their expiry date. They may have deteriorated to the extent that they won't survive a fill, or may burst much earlier than expected. But there are some valid bargains out there. Caveat emtor.

I've cc'd this to the GPSL reflector, which has become the ad hoc forum for technical issues related to ARHAB.

Thanks, Matt,

It's great to see that ARHAB is finally alive in the Jolly Olde! And from Cambridge, where I attended 2nd grade at Milton Road School in 1950. We didn't do that sort of thing back then!

Perhaps the UK FAA has set aside it's earlier prohibition on use of ham radio on balloons.

Britain’s space programme may have been in the doldrums since the disappearance of the Mars probe Beagle 2, but we are back in the race thanks to some soft-toy astronauts.

Four teddy bears dressed in space suits designed by schoolchildren were launched into the stratosphere by students from Cambridge University’s space-flight club.

Hi Bruce,

We've had some luck using a window made from clear mylar sheet over the view port, coated with windshield-grade RainX. A handy source of clear mylar is an old inkjet transparency cleaned off using 70% isopropyl alcohol. The window prevents forced convection from the slipstream and keeps whatever warm air inside. But, if the inside air is moist, it can frost up the interior surface of the window. We've used the little desiccant packs that come with some electronics to combat that issue.

You're wise NOT to apply anything to the lens surface directly, as that would risk damaging the anti-reflective coating.

If can keep the lens temperature above the dew point using copious insulation and waste heat from the camera and other heat generators in the payload, that'll work, too. I heard a story that TV cameramen at the winter Olympics a few years ago would connect a pair of 9V alkaline transistor radio batteries face to face, effectively shorting them out, and duct taping them to their lenses to keep 'em warm.

One other scheme that's worked for us is to use a pair of crossed polarized plastic filter sheets over our up-looking camera port, originally intended to form a 1% transmissive filter to reduce image contrast so we could see the shading on the balloon. 99% of the light striking this filter is absorbed, producing heat. That window also has a homebrew sunshade painted flat black to keep direct sunlight from making flares in the image.

4847. Pump Recommendations

Yahoo group: GPSL (2002 — 2008)
Date: 2008-12-11 17:25:55 UTC
From: Michael Gray
Topic: 4847 Message: 4847

We (ANSR) are working on the final assembly of our zero pressure balloon project. One of the requirements is for a ballast pump that is capable pumping anti-freeze at cold temperature (-40degF). On a previous flight we used a small pump that was submerged in the ballast container. Does anyone have a pump or recommended source for this type of pump?

Desired characteristics

3-6 VDC
Current < 300mA
Submersible

http://kd7lmo.net/pump.jpg

Thanks for any suggestions

I'd second that. The only times we've had icing problems is when
we tried using windows. A bare lens never gave us problems,
except for the one that landed in a lake :-).

UT amateur radio club in Knoxville, TN

has a pretty good be of experience with both ethanol and anti-freeze
being pumped out during the flight. (and/or not pumped) (-40° is really darn cold)

In the spirit of friendly competition
they have gone closed source for the time being with their information wiki

But if you are not trying to do the Trans-Atlantic flight
someone involved with the Knoxville club's balloon flights might give you some good
suggestions on the phone.

Take Care,
Carlton Corbitt

Subject: [GPSL] Pump Recommendations

We (ANSR) are working on the final assembly of our zero pressure balloon
project. One of the requirements is for a ballast pump that is capable
pumping anti-freeze at cold temperature (-40degF). On a previous flight
we used a small pump that was submerged in the ballast container. Does
anyone have a pump or recommended source for this type of pump?

Desired characteristics

3-6 VDC
Current < 300mA
Submersible

http://kd7lmo.net/pump.jpg

Thanks for any suggestions
73s de KD7LMO

Be careful to get the handwarmers that carry their own oxidizer - some of 'em rely ambient O2 which there's not much of at 10 mbar!

If there's a reasonable balance between internal heat dissipation and thermal resistance to the slipstream, pre-heating shouldn't be necessary unless the ambient at the launch site is worse than what we endured last month for EOSS-133 & -134 (-6C! - brrrr!). Keeping the sensitive payloads inside a toasty car until just before flight string prep may help as well - I do this with the RG-8 size coax so it won't bend like rebar during ground station setup.

4855. Re: Pump Recommendations

Yahoo group: GPSL (2002 — 2008)
Date: 2008-12-13 02:57:38 UTC
From: K. Mark Caviezel
Topic: 4847 Message: 4855

I'm pretty sure the UTARC guys used a solenoid valve like this:
http://www.pneuaire.com/lowwasu34wav.html
which is the lightest and most power miserly solenoid valve I've ever seen.

If you combine that valve with a 2 l or 3 l plastic soda bottle and ethanol ballast, you've got a darn fine ballast system.

I'm pretty sure they used this valve in non pressurized 'slow dribble' mode as well as a CO2 pressurized 'power squirt' mode.

KD7LMO: I bought that pump from Edmund Scientific, but I couldn't find it on their website now.

All: It gets a lot colder than -40C at night in the stratosphere. Planning for -80C may be better. The forecast calls for -60 C at FL480 over my house this evening:
http://adds.aviationweather.gov/winds/

Due to their high freezing points, ethylene glycol and propylene glycol automotive antifreezes, even when mixed with the proper amount of water to depress the freezing point are not suitable ballast liquids.

best regards,

- Mark ng0x

Manned He balloonists use dry sand for ballast, altho I'm not sure how one might configure a means to release it remotely in controlled quantities. Maybe a screw feeder like on coal-fired furnaces of yor? If there's suitable liquid ballast, then perhaps one could rig the tank with a vertical "straw" running from the bottom and out the top, and use an air pump or solenoid-controlled gas cartridge to pressurize the top of the tank? That would let the control goodies stay indoors where it's a bit cozier. Of course, the tank could stay indoors as well, thus providing some thermal mass to make it thru the night.

Thanks for all the guidance and information. We are going to try the valve with ethanol ballast system. I've ordered a couple valves and fittings. I'll test the setup in a thermal chamber. I can get down to -70degF.

4858. GlobalStar backup tracker FindMeSpot on sale

Yahoo group: GPSL (2002 — 2008)
Date: 2008-12-14 20:30:04 UTC
From: wb8elk@aol.com
Topic: 4858 Message: 4858

I just learned that the FindMeSpot unit that I've used quite successfully as a backup balloon tracker is on sale until Dec.31 (stops above 60,000 feet but comes to life below that).

After a mail-in rebate they are $99 each instead of the normal $149. Plus some of the retailers offer free shipping. I ordered mine from Cabelas.

http://www.findmespot.com (http://www.findmespot.com)

You'll have to sign up for the tracking service to activate them however....that's $99 a year for unlimited use....an additional $49 a year for the 24 hour continuous track mode with map (reports every 10 minutes).

I now fly these for most larger missions as it's 7 ounces of fairly inexpensive backup....It's saved me several times when my landing spot has been out of range of digipeaters or there was an APRS tracker failure. It'll work even upside down on the ground and sends it's position directly to the orbiting GlobalStar network every 10 minutes or so. It also comes in handy when we hike into rugged terrain as there's a 911 button on it that will alert search and rescue in case of emergency.

Hi Bill,

I guess that system works well if you have cell phone coverage near the
landing site. E. Colo has a lot of "no bars" territory for any service.
So we'll stick with the ham bands.

4862. Trimble Copernicus now flight qualified over 60k feet

Yahoo group: GPSL (2002 — 2008)
Date: 2008-12-15 00:40:42 UTC
From: wb8elk@aol.com
Topic: 4862 Message: 4862

In my last flight this past Saturday, I proved out that the Trimble Copernicus will work above the 60k foot limit....It tracked up to the burst at 104,891 feet (31971 meters).

However, it still seems to be desensed by local 2m and 70cm RF signals.....I tried it with a passive helix antenna this time made by Sarantel, but it went in and out of lock during the flight.....The active antenna that I used on it before that was very sensitive to desense by the ozonesonde on 403 MHz and wasn't usable in that environment....at least this time it did track part of the time. I'll try some different antennas on it to try to find one that works with nearby 2m and 440 MHz transmitters.

Highest reported track during this weekend's ozonesonde hitchhiker via AFSK RTTY on 2m FM:

WB8ELK-15:/163/213214/3456.81/08437.33/090/072/1/06/31971/8.86/6/63/W

To decode the above telemetry frame:

Callsign:/seq#/time/latitude/longitude/spd/hdg/lock/sats/altitude/voltage/temp/press/W

>>for "lock" field: 0 = no tracking, 1 = locked and tracking, 2 = DGPS (WAAS)
>> note that altitude is in 'meters'.

4863. Addendum to Trimble Copernicus posting

Yahoo group: GPSL (2002 — 2008)
Date: 2008-12-15 01:00:23 UTC
From: wb8elk@aol.com
Topic: 4863 Message: 4863

Just as a note....to get the Trimble Copernicus to work above the 60,000 foot limit (actually it stops at 27,000 feet in LAND mode) you must configure it to run in 'AIR' mode....not the LAND mode that comes as the default setting.

Also....it is interesting to note that I was surprised that the Deluo GPS unit that N4XWC flew on my Field Day balloon stopped working at 78,000 feet instead of the 60,000 foot limit I expected it to fail....it turns out that the reason that it failed at 78,000 feet is most likely due to a Kalman Filtering limit that some manufacturers put in their GPS code instead of due to the DoD limit.

4864. Re: [GPSL] GlobalStar backup tracker FindMeSpot on sale

Yahoo group: GPSL (2002 — 2008)
Date: 2008-12-15 01:38:10 UTC
From: Mike Manes
Topic: 4858 Message: 4864

I was referring to how a tracker gets the data, not how it's delivered by
the beacon.

Oh -- I think I get where you're coming from. If you're searching for
the device (balloon), you need cell phone service to access the
findmespot reporting service.

Sorry about that!

Thanks, Gary,

I've cc'ed Ralph W0RPK who mothers the balloon group archives. Don't recall having seen Austria show up on the announcements. Then again, they may not be running ham radio aboard - but that's not show-stopper.

Hi Paul,

Actually I think we have two, one for the FAA another for the Scouts.

What's up?

Merry Christmas and Happy New Year.

We would love to Paul. Tell me more about them.
